

Organ Pipe Design

In this model, an organ flue pipe is designed and analyzed using a pipe acoustics model. Because it is a 1D model, it is fast to solve but still retains most of the relevant physical parameters when designing an organ pipe. The model includes the elastic properties of the organ pipe walls, the end impedance properties at the open pipe end, and the possibility to add a small background airflow inside the pipe. In this model, the pipe is driven at 440 Hz which is the A4 note (or a').

A sketch of an organ pipe is shown in Figure 1. An airflow is pushed in at the bottom of the organ pipe and out via the mouth. At the mouth, an air jet strikes the sharp upper lip and this sets the air into vibration. The vibrations resonate with the organ pipe body to create the note of the pipe. In an open pipe, like the one sketched here, the fundamental tone corresponds to a half wave resonance in the pipe. The harmonics are then multiples of this frequency.

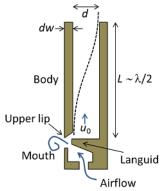

Figure 1: Sketch of an organ pipe including the mouth and the pipe body.

Note: This application requires the Acoustics Module or the Pipe Flow Module.

The timbre of the organ pipe depends on the combination of the fundamental tone and all the harmonics. This depends on the shape of the pipe (the length and diameter) as well as on the elastic properties of the pipe walls and their thickness. Moreover, a small residual airflow in the pipe u_0 , may alter the natural frequencies slightly (this effect is not modeled here). Changing any of these parameters influences not only the natural frequencies of the organ pipe, but also the damping and Q value of the corresponding frequency response resonance peaks. This in turn yields a different timbre.

Model Definition

The organ pipe geometry is defined in terms of its length L, inner pipe diameter d, wall thickness dw (see Figure 1), and cross-section shape (here circular). Only the length is used when drawing the pipe geometry as a straight line segment. The inner radius, wall thickness, and pipe shape are parameters entering the governing equations. The elastic properties of the pipe wall are Young's modulus $E_{\rm w}$ and Poisson's ratio $v_{\rm w}$. The model parameters are given in the table below.

TABLE I: MODEL PARAMETERS.

NAME	EXPRESSION	DESCRIPTION	
f	440 Hz	Frequency of an A4 note	
$L_{ m guess}$	$c_0/(2 f)$	Half wavelength at f	
L	0.3805 m	Pipe length giving a resonance at 440 Hz	
d	3 cm	Inner pipe diameter	
dw	2 mm	Wall thickness	
$E_{ m w}$	10 ⁹ Pa	Pipe wall Young's modulus	
$\nu_{\rm w}$	0.4	Pipe wall Poisson's ratio	
c_0	343 m/s	Speed of sound	
ka	0.12	Wave number times tube radius	
h_{\min}	$c_0/3000~{\rm Hz}/20$	Mesh size at 3000 Hz	
T_0	20°C	Ambient temperature	
p_0	l atm	Ambient pressure	
dL	0.6 <i>a</i>	End correction	
$f_{ m est}$	$c_0/(2(L+dL)$	Estimated resonance frequency	

The open end of the pipe is modeled by adding an end impedance property. This is an engineering relation for the case of a pipe of circular cross section ending in free space (an unflanged pipe).

Results and Discussion

The frequency response of the pipe is obtained by plotting the sound pressure level $L_{
m p}$ at the open pipe end,

$$L_{\rm p} = 10\log\left[\left(\frac{p_{\rm rms}}{p_{\rm ref}}\right)^2\right] \qquad p_{\rm rms}^2 = \frac{1}{2}pp^*$$

where p_{ref} is the reference pressure for air, 20 µPa, and * is the complex conjugate.

The frequency response around the first resonance frequency is plotted in Figure 2 for several values of the pipe diameter. Changing the pipe diameter clearly shifts the resonance frequency but also changes the damping and Q value, that is, the width of the peak. Hence this is an important factor when designing organ pipes.

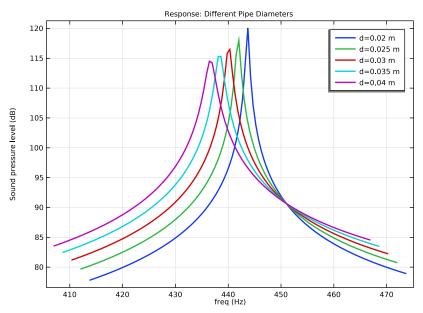

Figure 2: Resonance peak of the fundamental frequency at 440 Hz for different inner pipe diameters.

The response for different values of the pipe wall width is plotted in Figure 3. Here it is also seen that changing the pipe wall width (in general any of the pipe wall properties) changes the resonance slightly. This is because the elastic properties of the pipe wall have influence on the effective compressibility of the system in a given cross section. This in turn changes the effective speed of sound in the pipe and thus the resonance. The value of Young's modulus in this example model was chosen to demonstrate this effect. A typical circular organ pipe is however made of a tin-lead alloy, which has a much higher value of Young's modulus.

In the final plot in Figure 4, the parameter values giving a fundamental resonance at 440 Hz are selected (see the parameters list) and the response is plotted for frequencies from 100 Hz to 3000 Hz. The plot shows the fundamental resonance at 440 Hz as well as the following five resonance frequencies of the organ pipe. The shape of this curve is related to the timbre of the pipe.

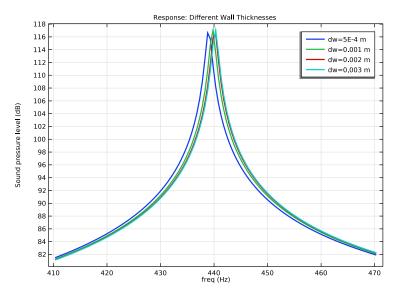

Figure 3: Resonance peak of the fundamental frequency at 440 Hz for different pipe wall thickness.

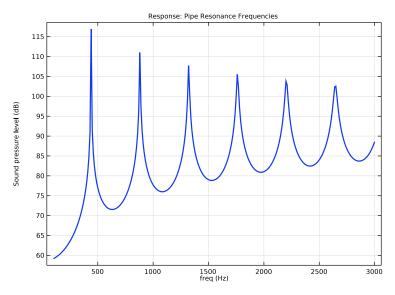

Figure 4: Resonance peaks of the six first natural frequencies of the pipe from 100 to 3000 Hz.

Application Library path: Acoustics Module/Tutorials, Pipe Acoustics/ organ_pipe_design

Modeling Instructions

From the File menu, choose New.

NEW

In the New window, click Model Wizard.

MODEL WIZARD

- I In the Model Wizard window, click **3D**.
- 2 In the Select Physics tree, select Acoustics>Pipe Acoustics>Pipe Acoustics, Frequency Domain (pafd).
- 3 Click Add.
- 4 Click \Longrightarrow Study.
- 5 In the Select Study tree, select General Studies>Frequency Domain.
- 6 Click **Done**.

GLOBAL DEFINITIONS

Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- 3 Click Load from File.
- 4 Browse to the model's Application Libraries folder and double-click the file organ_pipe_design_parameters.txt.

GEOMETRY I

Polygon I (poll)

- I In the Geometry toolbar, click \bigcirc More Primitives and choose Polygon.
- 2 In the Settings window for Polygon, locate the Coordinates section.

3 In the table, enter the following settings:

x (m)	y (m)	z (m)
0	0	0
0	0	L

4 Click Build All Objects.

ADD MATERIAL

- I In the Home toolbar, click Radd Material to open the Add Material window.
- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>Air.
- **4** Click **Add to Component** in the window toolbar.
- 5 In the Home toolbar, click **‡ Add Material** to close the **Add Material** window.

PIPE ACOUSTICS, FREQUENCY DOMAIN (PAFD)

Set the cross-section shape of the organ pipe and the elastic properties of the pipe walls.

Fluid Properties 1

- I In the Model Builder window, under Component I (compl)>Pipe Acoustics, Frequency Domain (pafd) click Fluid Properties 1.
- 2 In the Settings window for Fluid Properties, locate the Model Input section.
- **3** In the T_0 text field, type T0.
- **4** In the p_0 text field, type p0.

Pipe Properties I

- I In the Model Builder window, click Pipe Properties I.
- 2 In the Settings window for Pipe Properties, locate the Pipe Shape section.
- 3 From the list, choose Circular.
- **4** In the d_i text field, type d.
- 5 Locate the Pipe Model section. From the Pipe model list, choose Anchored at one end.
- **6** From the E list, choose **User defined**. In the associated text field, type Ew.
- 7 From the v list, choose **User defined**. In the associated text field, type nuw.
- **8** In the Δw text field, type dw.

End Impedance I

At the open end, the organ pipe is sitting in free air. Use the **Unflanged pipe**, circular end impedance to get the correct acoustic behavior here. Note that a low ka limit version, which is valid for $k \cdot a \ll 1$, is also available. However, it is not applicable for this model with $k \cdot a \ge 0.12$, as seen in the parameters list.

- I In the Physics toolbar, click Points and choose End Impedance.
- **2** Select Point 2 only.
- 3 In the Settings window for End Impedance, locate the End Impedance section.
- 4 From the Impedance model list, choose Unflanged pipe, circular.

Pressure 1

- I In the Physics toolbar, click Points and choose Pressure.
- 2 Select Point 1 only.
- 3 In the Settings window for Pressure, locate the Pressure section.
- 4 In the p_{in} text field, type 1.

MESH I

In this model, the mesh is set up manually. Proceed by directly adding the desired mesh component. In general, 5 to 6 second-order elements per wavelength are needed to resolve the waves. For more details, see Meshing (Resolving the Waves) in the Acoustics Module User's Guide. Here, we use 20 elements per wavelength at the maximum frequency.

Edge 1

- I In the Mesh toolbar, click A Boundary and choose Edge.
- **2** Select Edge 1 only.

Size

- I In the Model Builder window, click Size.
- 2 In the Settings window for Size, locate the Element Size section.
- **3** Click the **Custom** button.
- 4 Locate the Element Size Parameters section. In the Maximum element size text field, type h min.
- 5 In the Minimum element size text field, type h min/2.
- 6 Click **Build All**.

STUDY I

Step 1: Frequency Domain

- I In the Model Builder window, under Study I click Step I: Frequency Domain.
- 2 In the Settings window for Frequency Domain, locate the Study Settings section.
- 3 In the Frequencies text field, type range (f est-30,0.5,f est+30).

Here the variable f est corresponds to the estimated resonance frequency of the pipe taking the end correction into account. For narrow pipes the calculated resonance f est is close to the ideal A4 (or a') note of f = 440 Hz.

Parametric Sweep

The sweep over the pipe diameter is done using a Parametric Sweep.

- I In the Study toolbar, click Parametric Sweep.
- 2 In the Settings window for Parametric Sweep, locate the Study Settings section.
- 3 Click + Add.
- **4** In the table, enter the following settings:

Parameter name	Parameter value list	Parameter unit
d (Inner pipe diameter)	2[cm] 2.5[cm] 3[cm] 3.5[cm] 4[cm]	m

- 5 In the Model Builder window, click Study 1.
- 6 In the Settings window for Study, type Study 1 Inner Pipe Diameter Sweep in the Label text field.
- 7 In the Study toolbar, click **Compute**.

ADD STUDY

- I In the Study toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies> Frequency Domain.
- 4 Click Add Study in the window toolbar.
- 5 In the Study toolbar, click Add Study to close the Add Study window.

STUDY 2

Step 1: Frequency Domain

I In the Settings window for Frequency Domain, locate the Study Settings section.

- 2 In the Frequencies text field, type range (f est-30,0.5,f est+30).
- 3 Click to expand the Study Extensions section. Select the Auxiliary sweep check box.
- 4 Click + Add.
- **5** In the table, enter the following settings:

Parameter name	Parameter value list	Parameter unit
dw (Pipe wall thickness)	0.5[mm] 1[mm] 2[mm] 3[mm]	m

- 6 In the Model Builder window, click Study 2.
- 7 In the Settings window for Study, type Study 2 Pipe Wall Thickness Sweep in the Label text field.
- 8 Locate the Study Settings section. Clear the Generate default plots check box.
- 9 In the Study toolbar, click **Compute**.

ADD STUDY

- I In the Study toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies> Frequency Domain.
- 4 Click Add Study in the window toolbar.
- 5 In the Study toolbar, click Add Study to close the Add Study window.

STUDY 3

Step 1: Frequency Domain

- I In the Settings window for Frequency Domain, locate the Study Settings section.
- 2 In the Frequencies text field, type range (100, 10, 3000).
- 3 In the Model Builder window, click Study 3.
- 4 In the Settings window for Study, type Study 3 Extended Frequency Sweep in the Label text field.
- 5 Locate the Study Settings section. Clear the Generate default plots check box.
- 6 In the Study toolbar, click **Compute**.

RESULTS

Acoustic Pressure (pafd)

The first two figures show the pressure distribution and the velocity field in the pipe section as line plots in 3D. You can select different parameter values and frequencies and evaluate the plots to study the pressure distribution in the pipe.

Next, create three plots that show the frequency response of the organ pipe. This is here the sound pressure level evaluated at the open end of the of the pipe for three different cases. The first shows the fundamental resonance and how it depends on the inner tube diameter. The next shows the dependency on the tube wall thickness. The final plot shows the solution for a larger frequency range including the six first resonance frequencies.

Response: Different Pipe Diameters

- I In the Home toolbar, click **Add Plot Group** and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, locate the Data section.
- 3 From the Dataset list, choose Study I Inner Pipe Diameter Sweep/ Parametric Solutions I (sol2).
- 4 In the Label text field, type Response: Different Pipe Diameters.
- **5** Click to expand the **Title** section. From the **Title type** list, choose **Label**.

Point Grabh 1

- I Right-click Response: Different Pipe Diameters and choose Point Graph.
- **2** Select Point 2 only.
- 3 In the Settings window for Point Graph, click Replace Expression in the upper-right corner of the y-Axis Data section. From the menu, choose Component I (compl)> Pipe Acoustics, Frequency Domain>Intensity and sound pressure level>pafd.Lp -Sound pressure level - dB.
- 4 Click to expand the Coloring and Style section. From the Width list, choose 2.
- 5 Click to expand the **Legends** section. Select the **Show legends** check box.
- **6** Find the **Include** subsection. Clear the **Point** check box.
- The figure should look like the one in Figure 2.

Response: Different Wall Thicknesses

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, locate the Data section.
- 3 From the Dataset list, choose Study 2 Pipe Wall Thickness Sweep/Solution 8 (sol8).

- 4 In the Label text field, type Response: Different Wall Thicknesses.
- **5** Locate the **Title** section. From the **Title type** list, choose **Label**.

Point Graph 1

- I Right-click Response: Different Wall Thicknesses and choose Point Graph.
- 2 Select Point 2 only.
- 3 In the Settings window for Point Graph, locate the y-Axis Data section.
- 4 In the Expression text field, type pafd.Lp.
- 5 Locate the x-Axis Data section. From the Axis source data list, choose freq.
- 6 Locate the Coloring and Style section. From the Width list, choose 2.
- 7 Locate the **Legends** section. Select the **Show legends** check box.
- **8** Find the **Include** subsection. Clear the **Point** check box.
- **9** In the Response: Different Wall Thicknesses toolbar, click **Plot**. The figure should look like the one in Figure 3.

Response: Pipe Resonance Frequencies

- I In the Home toolbar, click In Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, locate the Data section.
- 3 From the Dataset list, choose Study 3 Extended Frequency Sweep/Solution 9 (sol9).
- 4 In the Label text field, type Response: Pipe Resonance Frequencies.
- **5** Locate the **Title** section. From the **Title type** list, choose **Label**.

Point Graph 1

- I Right-click Response: Pipe Resonance Frequencies and choose Point Graph.
- **2** Select Point 2 only.
- 3 In the Settings window for Point Graph, locate the y-Axis Data section.
- 4 In the Expression text field, type pafd.Lp.
- 5 Locate the Coloring and Style section. From the Width list, choose 2.
- The figure should look like the one in Figure 4.
