

Thermal Performances of Windows

During the design of a building, environmental issues have gained considerable influence in the entire project. One of the first concerns is to improve thermal performances. In this process, simulation softwares provide key tools for modeling thermal losses and performances in the building.

The international standard ISO 10077-2:2012 (Ref. 1) deals with thermal performances of windows, doors, and shutters. It provides computed values of the thermal characteristics of frame profiles in order to validate a simulation software.

COMSOL Multiphysics successfully passes the entire benchmark. This document describes six frame profiles of ISO 10077-2:2012 related to windows only. Other test cases from this standard are available in the following applications:

- Thermal Performances of Roller Shutters
- Glazing Influence on Thermal Performances of a Window

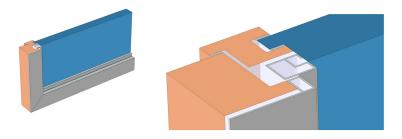

Figure 1: Geometry of one of the windows and cross-section view.

Model Definition

On each test case, a window section separates a hot internal side from a cold external side. In these applications, the traditional glazing is replaced by an insulation panel. After solving a model, two quantities are calculated and compared to the normative values:

- The thermal conductance between the internal and external sides
- The thermal transmittance of the window frame

AIR CAVITIES

A window frame contains many cavities. The purpose is to ensure thermal insulation. According to the standard, cavities are modeled in different ways, depending on their shapes and on the width of the slit connecting them to the interior or exterior environment. Cavities are divided into three types:

- unventilated cavities, completely closed or connected either to the exterior or to the interior by a slit with a width not exceeding 2 mm
- slightly ventilated cavities, connected either to the exterior or to the interior by a slit greater than 2 mm but not exceeding 10 mm
- well-ventilated cavities, corresponding to a configuration not covered by one of the two preceding types

In unventilated and slightly ventilated cavities, the heat flow rate is represented by an equivalent thermal conductivity k_{eq} , which includes the heat flow by conduction, convection, and radiation, and depends on the geometry of the cavity and on the adjacent materials. See Unventilated Rectangular Cavity, Slightly Ventilated Rectangular Cavities, and Nonrectangular Cavities for the definition of k_{eq} . These cavities are explicitly represented as domains in the geometry.

In well-ventilated cavities, it is assumed that the whole surface of the cavity is exposed to the interior or exterior environment. Therefore, the interior of these cavities is not explicitly represented as a domain, and convective heat flux boundary conditions are applied instead to the surface of the cavity (see the Boundary conditions section below for more information). See Figure 8 for an example configuration containing such a cavity connected to the exterior.

Unventilated Rectangular Cavity

For an unventilated rectangular cavity, the equivalent thermal conductivity is defined by:

$$k_{\rm eq} = \frac{d}{R}$$

where d is the cavity dimension in the heat flow rate direction, and R is the cavity thermal resistance given by:

$$R = \frac{1}{h_a + h_r}$$

where h_a is the convective heat transfer coefficient, and h_r is the radiative heat transfer coefficient. These coefficients are defined by:

$$h_{\rm a} = \left\{ \begin{array}{c} \frac{C_1}{d} & \text{if } b \leq 5 \text{ mm} \\ \\ \max \left(\frac{C_1}{d}, C_2 \Delta T^{1/3} \right) & \text{otherwise} \end{array} \right.$$

$$h_{\rm r} = 4\sigma T_{\rm m}^3 EF$$

where:

- $C_1 = 0.025 \text{ W/(m·K)}$
- $C_2 = 0.73 \text{ W/(m}^2 \cdot \text{K}^{4/3})$
- ΔT is the maximum surface temperature difference in the cavity
- $\sigma = 5.67 \cdot 10^{-8} \ \text{W/(m}^2 \cdot \text{K}^4)$ is the Stefan-Boltzmann constant
- $T_{\rm m}$ is the average temperature on the boundaries of the cavity
- *E* is the intersurface emittance, defined by:

$$E = \frac{1}{\frac{1}{\varepsilon_1} + \frac{1}{\varepsilon_2} - 1}$$

- ε_1 and ε_2 are the surface emissivities (both are equal to 0.90 in this model)
- F is the view factor of the rectangular section, defined by:

$$F = \frac{1}{2} \left(1 - \frac{d}{b} + \sqrt{1 + \left(\frac{d}{b}\right)^2} \right)$$

- d is the cavity dimension in the heat flow rate direction
- *b* is the cavity dimension perpendicular to the heat flow rate direction

Slightly Ventilated Rectangular Cavities

For a slightly ventilated cavity, the equivalent thermal conductivity is twice that of an unventilated cavity of the same size.

Nonrectangular Cavities

Nonrectangular cavities are transformed into rectangular cavities of same area and aspect ratio according to defined rules in ISO 10077-2:2012 presented below. Then, $k_{\rm eq}$ is evaluated following one of the two previous rectangular cases.

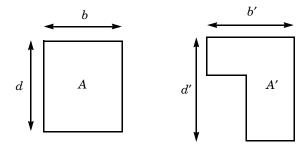

Figure 2: Nonrectangular cavity transformation.

Figure 2 shows a nonrectangular cavity of area A'. Then, d' and b' are the depth and the width (in accordance with the direction of the heat flow) of the smallest rectangle than can contain of the nonrectangular cavity. The equivalent rectangular cavity, of size $b \times d$ and area A must satisfy:

$$A = A' \qquad \frac{d}{b} = \frac{d'}{b'}$$

Hence, b and d are given by:

$$b = \sqrt{A'\frac{b'}{d'}} \qquad d = \sqrt{A'\frac{d'}{b'}}$$

BOUNDARY CONDITIONS

The heat flux conditions for internal and external sides are given by Newton's law of cooling:

$$-\mathbf{n}\cdot(-k\nabla T) \,=\, h(T_{\mathrm{ext}}-T)$$

where $T_{
m ext}$ is the exterior temperature ($T_{
m ext}$ = $T_{
m i}$ = 20°C for the internal side and $T_{\rm ext}$ = $T_{\rm e}$ = 0°C for the external side). The standard defines thermal surface resistance, $R_{\rm s}$, which is related to the heat transfer coefficient, h, by:

$$h = \frac{1}{R_s}$$

Internal and external thermal surface resistances are not equal. Moreover, on boundaries linked to the internal side, an increased thermal resistance is used in edges. Figure 3 explains how to determine boundaries where it should be applied.

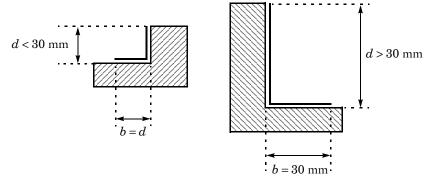

Figure 3: Protected boundaries.

If d is greater than 30 mm, b is set to 30 mm. Otherwise, b = d is chosen. Furthermore, two boundaries are considered as adiabatic: the boundary in contact with the wall and the end of the insulation panel.

DESCRIPTION OF THE SIX APPLICATIONS

Figure 4 to Figure 9 depict the geometry of each application but only a part of the insulation panel is represented. Unventilated cavities are red-numbered while slightly ventilated cavities are green-numbered. Boundaries with an increased thermal resistance are represented with bold black lines. Adiabatic boundaries in contact with the wall are represented with a striped rectangle.

Application 1: Aluminum Frame with Thermal Break

The first application studies the heat conduction in an aluminum frame section with thermal break. The frame structure is made of aluminum with a high thermal conductivity k of 160 W/(m·K). Four barriers made of polyamide 6.6 with 25% of glass fiber compose the thermal break. They have a low thermal conductivity of 0.30 W/(m·K). Ethylene propylene diene monomer (EPDM) rubber gaskets are also used to waterproof the window. EPDM rubber has a thermal conductivity of 0.25 W/(m·K). The insulation panel has a very low thermal conductivity of 0.035 W/(m·K).

This frame is divided into many cavities: most of them (red-numbered from 1 to 9 on Figure 4) are considered as unventilated cavities because they are not connected to the exterior. One cavity is connected to the exterior. According to the standard, this cavity is cut into two "subcavities" due to its internal 2 mm width slit. The first cavity (red-

numbered 10 on Figure 4) is considered as unventilated cavity and the second cavity (green-numbered 1 on Figure 4) is considered as a slightly ventilated cavity.

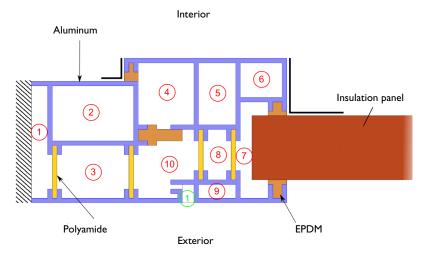

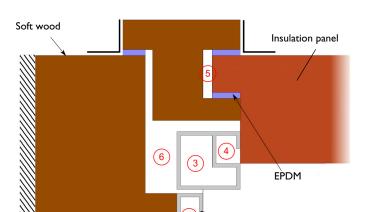

Figure 4: Geometry of the first window.

Application 2: Aluminum Clad Wood Frame

The second application studies the heat conduction in an aluminum clad wood frame section. The frame is made of two wood blocks with a thermal conductivity of 0.13 W/ (m·K). On the external side, a wood block is covered by an aluminum structure which has a high thermal conductivity. This application includes EPDM gaskets too.

All cavities are considered as unventilated cavities because they are either closed or connected to the exterior by a 2 mm width slit.

Interior

Exterior

Figure 5: Geometry of the second window.

Application 3: PVC Frame with Steel Reinforcement

The third application studies the heat conduction in a PVC frame section with steel reinforcement. The main structure of the frame is made of PVC, which has a thermal conductivity of 0.17 W/(m·K). Two reinforcements made of steel are also present. Steel has a high thermal conductivity of 50 W/(m·K). EPDM gaskets are used.

Aluminum

Air cavities are all completely closed or connected to the exterior by a slit with a width not exceeding 2 mm. Thus they are considered as unventilated cavities.

Interior

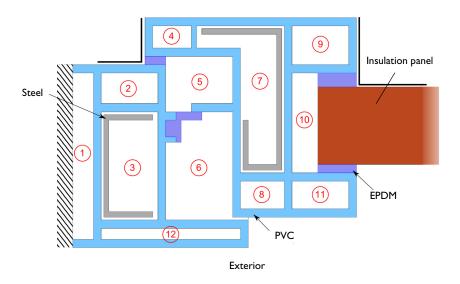

Figure 6: Geometry of the third window.

Application 4: Roof Window

The fourth application studies the heat conduction in a roof window frame section. The main part of the frame is made of two soft wood blocks. The interior part is aluminum clad and there are also EPDM gaskets.

Three air cavities are not connected to the exterior or only by a slit with a width smaller than 2 mm. They are considered as unventilated. Four others air cavities are considered as slightly ventilated cavities.

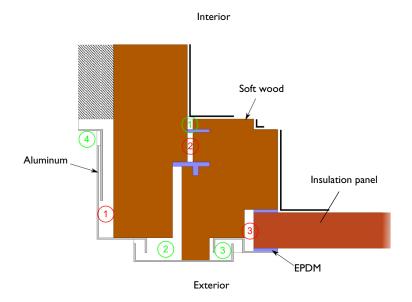

Figure 7: Geometry of the fourth window.

Application 5: Sliding Window

The fifth application studies the heat conduction in a sliding window frame section. The frame has an aluminum structure with a high thermal conductivity. There are some thermal breaks made of rigid polyurethane (PU), polyamide, and polyester mohair. Their thermal conductivities are 0.25 W/(m·K), 0.25 W/(m·K), and 0.14 W/(m·K), respectively. There are also some EPDM gaskets to waterproof the window.

Four air cavities are completely closed, and two others are connected to the exterior by a 2 mm width slit. According to the standard, they are considered as unventilated cavities. One cavity is considered as a *slightly ventilated cavity* because it is connected to the exterior by a larger slit of 6 mm. In addition, one last cavity is considered as well ventilated because it is connected to the exterior with a 15 mm width slit.

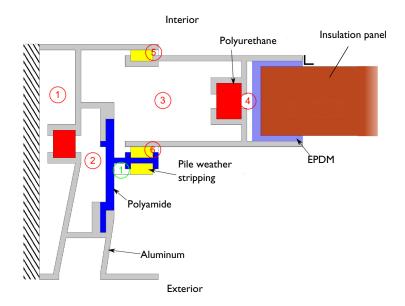

Figure 8: Geometry of the fifth window.

Application 6: PVC Frame

The sixth application studies the heat conduction in a fixed PVC frame section. Polyamide with a thermal conductivity of 0.25 W/(m·K) is used. There are also some EPDM gaskets to waterproof the window.

In this application, there are seven closed cavities. They are considered as unventilated. In addition, one cavity is connected to the exterior by a 3 mm width slit so it is considered as slightly ventilated.

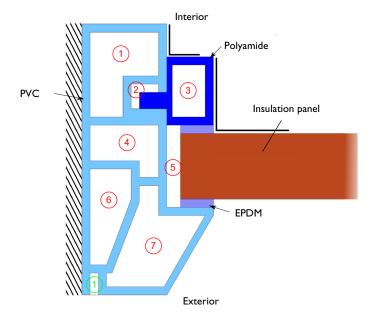

Figure 9: Geometry of the sixth window.

Results and Discussion

TEMPERATURE PROFILES

The temperature profiles for each application are shown in Figure 10 to Figure 15.

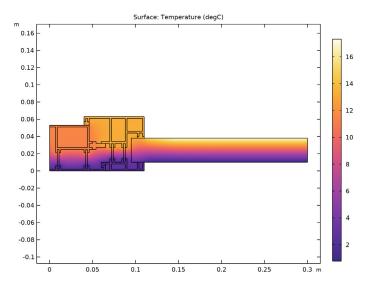

Figure 10: Temperature distribution in the aluminum frame with thermal break.

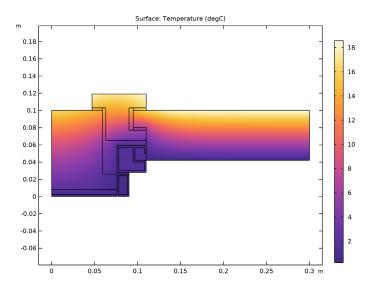

Figure 11: Temperature distribution in the aluminum clad wood frame.

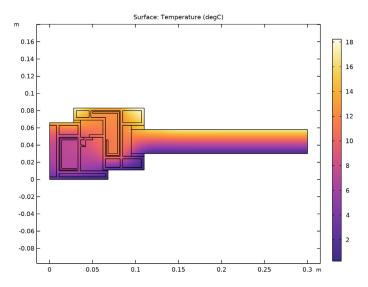

Figure 12: Temperature distribution in the PVC frame with steel reinforcement.

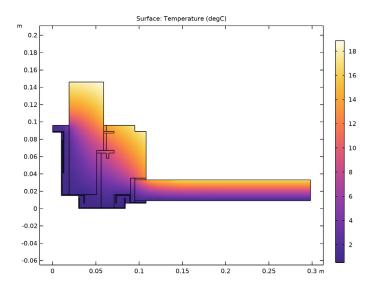

Figure 13: Temperature distribution in the roof window.

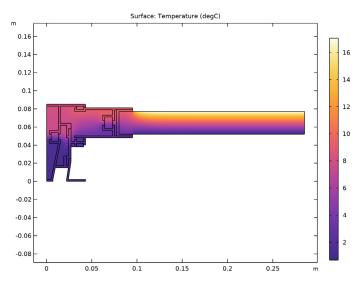

Figure 14: Temperature distribution in the sliding window.

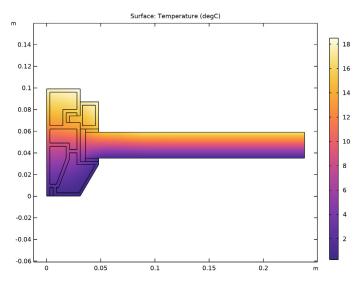

Figure 15: Temperature distribution in the PVC frame.

QUANTITIES OF INTEREST

The quantities of interest are the following:

• The thermal conductance of the entire section L^{2D} given by:

$$L^{\rm 2D} = \frac{\Phi}{T_{\rm e} - T_{\rm i}}$$

where ϕ is the heat flow rate through the window (in W/m), $T_e = 0$ °C is the external temperature and $T_i = 20^{\circ}$ C is the internal temperature

• The thermal transmittance of the frame U_{f} defined by:

$$U_{\rm f} = \frac{L^{\rm 2D} - U_{\rm p} b_{\rm p}}{b_{\rm f}}$$

where $b_{
m p}$ is the visible width of the panel expressed in meters, $b_{
m f}$ is the projected width of the frame section expressed in meters, and $U_{
m p}$ is the thermal transmittance of the central area of the panel expressed in $W/(m^2 \cdot K)$.

Table 1 to Table 6 compare the numerical results of COMSOL Multiphysics with the expected values provided by ISO 10077-2:2012.

TABLE I: COMPARISON BETWEEN EXPECTED AND COMPUTED VALUES OF QUANTITIES IN APPLICATION I.

QUANTITY	EXPECTED VALUE	COMPUTED VALUE	RELATIVE ERROR
$L^{\mathrm{2D}}\left(\mathrm{W/(m\cdot K)}\right)$	0.550	0.557	1.27%
$U_{\mathrm{f}}(\mathrm{W/(m^2\cdot K)})$	3.22	3.30	2.48%

TABLE 2: COMPARISON BETWEEN EXPECTED AND COMPUTED VALUES OF QUANTITIES IN APPLICATION 2.

QUANTITY	EXPECTED VALUE	COMPUTED VALUE	RELATIVE ERROR
L^{2D} (W/(m·K))	0.263	0.265	0.76%
$U_{\mathrm{f}}(W/(m^2\cdotK))$	1.44	1.47	2.1%

TABLE 3: COMPARISON BETWEEN EXPECTED AND COMPUTED VALUES OF QUANTITIES IN APPLICATION 3.

L2D (W/(M·K))	EXPECTED VALUE	COMPUTED VALUE	RELATIVE ERROR
L^{2D} (W/(m·K))	0.424	0.428	0.94%
$U_{\mathrm{f}}(\mathrm{W/(m^2\cdot K)})$	2.07	2.13	2.9%

TABLE 4: COMPARISON BETWEEN EXPECTED AND COMPUTED VALUES OF QUANTITIES IN APPLICATION 4.

L2D (W/(M·K))	EXPECTED VALUE	COMPUTED VALUE	RELATIVE ERROR
L^{2D} (W/(m·K))	0.408	0.412	0.98%
$U_{\mathrm{f}}(\mathrm{W/(m^2\cdot K)})$	2.08	2.17	4.3%

TABLE 5: COMPARISON BETWEEN EXPECTED AND COMPUTED VALUES OF QUANTITIES IN APPLICATION 5.

L2D (W/(M·K))	EXPECTED VALUE	COMPUTED VALUE	RELATIVE ERROR
L^{2D} (W/(m·K))	0.659	0.662	0.45%
$U_{\mathrm{f}}(\mathrm{W/(m^2\cdot K)})$	4.67	4.71	0.85%

TABLE 6: COMPARISON BETWEEN EXPECTED AND COMPUTED VALUES OF OUANTITIES IN APPLICATION 6.

L2D (W/(M·K))	EXPECTED VALUE	COMPUTED VALUE	RELATIVE ERROR
L^{2D} (W/(m·K))	0.285	0.284	0.35%
$U_{\mathrm{f}}(\mathrm{W/(m^2\cdot K)})$	1.31	1.35	3.1%

The maximum permissible differences to pass this test case are 3% for the thermal conductance and 5% for the thermal transmittance. The measured values are completely coherent and meet the validation criteria.

Application Library path: Heat Transfer Module/ Buildings and Constructions/windows thermal performances

Modeling Instructions

ROOT

Start by opening the following prepared file. It already contains global definitions, geometries, local variables, selections, operators and material properties.

APPLICATION LIBRARIES

- I From the File menu, choose Application Libraries.
- 2 In the Application Libraries window, select Heat Transfer Module> **Buildings and Constructions>windows_thermal_performances_preset** in the tree.
- 3 Click Open.

FIRST WINDOW (COMPI)

Click the **Zoom Extents** button in the **Graphics** toolbar.

First Window

FIRST WINDOW (COMPI)

In the Model Builder window, expand the First Window (compl) node.

DEFINITIONS (COMPI)

Variables 1

Define the thermal conductance of the section for the postprocessing part as follows.

- I In the Model Builder window, expand the First Window (compl)>Definitions node, then click Variables 1.
- 2 In the Settings window for Variables, locate the Variables section.
- **3** In the table, enter the following settings:

Name	Expression	Unit	Description
L2D	<pre>int_internal(ht.ntflux</pre>	W/(m·K)	Thermal conductance of
	/(Te-Ti))	, ,	the frame

Note that because boundaries linked to the wall and the end of the insulation panel are considered adiabatic, the heat flow rates through the internal and external boundaries are equal (in absolute values).

4 In the Model Builder window, collapse the First Window (compl)>Definitions node.

HEAT TRANSFER IN SOLIDS AND FLUIDS (HT)

- I In the Model Builder window, expand the Heat Transfer in Solids and Fluids (ht) node, then click Fluid 1.
- **2** Select Domains 2, 5, 6, 10, 12, 14, 15, 17, 18, 20, and 21 only.

Heat Flux 1

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Exterior Side.
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- 5 In the h text field, type 1/Rse.
- **6** In the $T_{\rm ext}$ text field, type Te.

Heat Flux 2

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Flat Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type $1/Rsi_n$.
- **6** In the T_{ext} text field, type Ti.

Heat Flux 3

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Corner Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rsi p.
- **6** In the T_{ext} text field, type Ti.
- 7 In the Model Builder window, collapse the Heat Transfer in Solids and Fluids (ht) node.

STUDY I

The heat flow rate through the interior (or exterior) side of the section needs to be determined to calculate the thermal conductance of the section. In order to have a sufficient precision on this value, the default relative tolerance of the solver has already been modified to 10^{-6} . To access to this value, expand the **Solver I** node and click on the Stationary Solver I node. In the Stationary Solver settings window, locate the General section.

I In the Home toolbar, click **Compute**.

RESULTS

Temperature (ht)

A Global Evaluation node is added in order to calculate the thermal conductance of the section and the thermal transmittance of the frame.

Thermal Conductance of the Section (L2D) I

- I In the Model Builder window, expand the Results>Derived Values node.
- 2 Right-click Results>Derived Values and choose Global Evaluation.
- 3 In the Settings window for Global Evaluation, type Thermal Conductance of the Section (L2D) 1 in the Label text field.
- **4** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
L2D	W/(m*K)	Thermal Conductance of the Section (L2D)
(L2D-Up*pvl)/f_wtot	W/(m^2*K)	Thermal Transmittance of the Frame (Uf)

5 Click **= Evaluate**.

TABLE

I Go to the **Table** window.

The results should be close to the expected values in Table 1.

RESULTS

Surface

- I In the Model Builder window, expand the Results>Temperature (ht) node, then click Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- **3** From the **Unit** list, choose **degC**.
- 4 In the Temperature (ht) toolbar, click Plot.

The current plot group shows the temperature distribution; compare with Figure 10.

The same simulation method is applied on five other benchmarks. The instructions below describe the steps to achieve the calculations.

FIRST WINDOW (COMPI)

In the Model Builder window, collapse the First Window (compl) node.

SECOND WINDOW (COMP2)

In the Model Builder window, expand the Second Window (comp2) node.

DEFINITIONS (COMP2)

Variables 2

- I In the Model Builder window, expand the Second Window (comp2)>Definitions node, then click Variables 2.
- 2 In the Settings window for Variables, locate the Variables section.
- **3** In the table, enter the following settings:

Name	Expression	Unit	Description
L2D	<pre>int_internal(ht2.ntflux /(Te-Ti))</pre>	W/(m·K)	Thermal conductance of the frame

4 In the Model Builder window, collapse the Second Window (comp2)>Definitions node.

HEAT TRANSFER IN SOLIDS AND FLUIDS 2 (HT2)

Fluid 1

- I In the Model Builder window, expand the Heat Transfer in Solids and Fluids 2 (ht2) node, then click Fluid 1.
- **2** Select Domains 2, 6, 8–10, and 14 only.

Heat Flux 1

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Exterior Side.
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rse.
- **6** In the $T_{\rm ext}$ text field, type Te.

Heat Flux 2

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Flat Area).

- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type $1/Rsi_n$.
- **6** In the T_{ext} text field, type Ti.

Heat Flux 3

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Corner Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rsi p.
- **6** In the $T_{\rm ext}$ text field, type Ti.
- 7 In the Model Builder window, collapse the Heat Transfer in Solids and Fluids 2 (ht2) node.

STUDY 2

In the **Home** toolbar, click **Compute**.

RESULTS

A Global Evaluation node is added in order to calculate the thermal conductance of the section and the thermal transmittance of the frame.

Thermal Conductance of the Section (L2D) 2

- I In the Results toolbar, click (8.5) Global Evaluation.
- 2 In the Settings window for Global Evaluation, type Thermal Conductance of the Section (L2D) 2 in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 2/Solution 2 (8) (sol2).
- **4** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
L2D	W/(m*K)	Thermal Conductance of the Section (L2D)
(L2D-Up*pv1)/f_wtot	W/(m^2*K)	Thermal Transmittance of the Frame (Uf)

5 Click **= Evaluate**.

TABLE

I Go to the **Table** window.

The results should be close to the expected values in Table 2.

RESULTS

Surface

- I In the Model Builder window, expand the Results>Temperature (ht2) node, then click Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- 3 From the Unit list, choose degC.
- 4 In the Temperature (ht2) toolbar, click **Plot**.

The current plot group shows the temperature distribution; compare with Figure 11.

SECOND WINDOW (COMP2)

In the Model Builder window, collapse the Second Window (comp2) node.

Third Window

THIRD WINDOW (COMP3)

In the Model Builder window, expand the Third Window (comp3) node.

DEFINITIONS (COMP3)

Variables 3

- I In the Model Builder window, expand the Third Window (comp3)>Definitions node, then click Variables 3.
- 2 In the Settings window for Variables, locate the Variables section.
- **3** In the table, enter the following settings:

Name	Expression	Unit	Description
L2D	<pre>int_internal(ht3.ntflux /(Te-Ti))</pre>	W/(m·K)	Thermal conductance of the frame

4 In the Model Builder window, collapse the Third Window (comp3)>Definitions node.

HEAT TRANSFER IN SOLIDS AND FLUIDS 3 (HT3)

Fluid 1

- I In the Model Builder window, expand the Heat Transfer in Solids and Fluids 3 (ht3) node, then click Fluid 1.
- **2** Select Domains 2–5, 9, 10, 12, 13, and 15–18 only.

Heat Flux I

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Exterior Side.
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rse.
- **6** In the $T_{\rm ext}$ text field, type Te.

Heat Flux 2

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Flat Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type $1/Rsi_n$.
- **6** In the T_{ext} text field, type Ti.

Heat Flux 3

- In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- **3** From the Selection list, choose Interior Side (Corner Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rsi p.
- **6** In the T_{ext} text field, type Ti.
- 7 In the Model Builder window, collapse the Heat Transfer in Solids and Fluids 3 (ht3) node.

Edit the default mesh settings to improve the mesh resolution of narrow regions.

MESH 3

Size

- I In the Model Builder window, under Third Window (comp3) right-click Mesh 3 and choose **Edit Physics-Induced Sequence.**
- 2 In the Settings window for Size, click to expand the Element Size Parameters section.
- 3 In the Resolution of narrow regions text field, type 2.
- 4 In the Model Builder window, collapse the Mesh 3 node.

STUDY 3

In the **Home** toolbar, click **Compute**.

RESULTS

A Global Evaluation node is added in order to calculate the thermal conductance of the section and the thermal transmittance of the frame.

Thermal Conductance of the Section (L2D) 3

- I In the Results toolbar, click (8.5) Global Evaluation.
- 2 In the Settings window for Global Evaluation, type Thermal Conductance of the Section (L2D) 3 in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 3/Solution 3 (15) (sol3).
- **4** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
L2D	W/(m*K)	Thermal Conductance of the Section (L2D)
(L2D-Up*pvl)/f_wtot	W/(m^2*K)	Thermal Transmittance of the Frame (Uf)

5 Click **= Evaluate**.

TABLE

I Go to the **Table** window.

The results should be close to the expected values in Table 3.

RESULTS

Surface

- I In the Model Builder window, expand the Results>Temperature (ht3) node, then click
- 2 In the Settings window for Surface, locate the Expression section.
- 3 From the Unit list, choose degC.
- 4 In the Temperature (ht3) toolbar, click Plot.

The current plot group shows the temperature distribution; compare with Figure 12.

THIRD WINDOW (COMP3)

In the Model Builder window, collapse the Third Window (comp3) node.

FOURTH WINDOW (COMP4)

In the Model Builder window, expand the Fourth Window (comp4) node.

DEFINITIONS (COMP4)

Variables 4

- I In the Model Builder window, expand the Fourth Window (comp4)>Definitions node, then click Variables 4.
- 2 In the Settings window for Variables, locate the Variables section.
- **3** In the table, enter the following settings:

Name	Expression	Unit	Description
L2D	<pre>int_internal(ht4.ntflux /(Te-Ti))</pre>	W/(m·K)	Thermal conductance of the frame

4 In the Model Builder window, collapse the Fourth Window (comp4)>Definitions node.

Another mean to improve the accuracy of the solution is to use second order elements for the discretization of the temperature field. Second order elements are particularly efficient for purely conductive models as the ones studied here.

HEAT TRANSFER IN SOLIDS AND FLUIDS 4 (HT4)

- I In the Model Builder window, under Fourth Window (comp4) click Heat Transfer in Solids and Fluids 4 (ht4).
- 2 In the Settings window for Heat Transfer in Solids and Fluids, click to expand the Discretization section.
- 3 From the Temperature list, choose Quadratic Lagrange.

Fluid 1

- I In the Model Builder window, expand the Heat Transfer in Solids and Fluids 4 (ht4) node, then click Fluid 1.
- **2** Select Domains 2, 4, 7, 10, 12, 13, and 15 only.

Heat Flux I

- In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Exterior Side.

- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rse.
- **6** In the $T_{\rm ext}$ text field, type Te.

Heat Flux 2

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Flat Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rsi n.
- **6** In the $T_{\rm ext}$ text field, type Ti.

Heat Flux 3

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Corner Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rsi p.
- **6** In the $T_{\rm ext}$ text field, type Ti.
- 7 In the Model Builder window, collapse the Heat Transfer in Solids and Fluids 4 (ht4) node.

Edit the default mesh settings to improve the mesh resolution of narrow regions.

MESH 4

Size

- I In the Model Builder window, under Fourth Window (comp4) right-click Mesh 4 and choose Edit Physics-Induced Sequence.
- 2 In the Settings window for Size, locate the Element Size Parameters section.
- 3 In the Resolution of narrow regions text field, type 2.
- 4 In the Model Builder window, collapse the Mesh 4 node.

STUDY 4

In the **Home** toolbar, click **Compute**.

RESULTS

A Global Evaluation node is added in order to calculate the thermal conductance of the section and the thermal transmittance of the frame.

Thermal Conductance of the Section (L2D) 4

- I In the Results toolbar, click (8.5) Global Evaluation.
- 2 In the Settings window for Global Evaluation, type Thermal Conductance of the Section (L2D) 4 in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 4/Solution 4 (22) (sol4).
- **4** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
L2D	W/(m*K)	Thermal Conductance of the Section (L2D)
(L2D-Up*pv1)/f_wtot	W/(m^2*K)	Thermal Transmittance of the Frame (Uf)

5 Click **= Evaluate**.

TABLE

I Go to the Table window.

The results should be close to the expected values in Table 4.

RESULTS

Surface

- I In the Model Builder window, expand the Results>Temperature (ht4) node, then click Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- 3 From the Unit list, choose degC.
- 4 In the Temperature (ht4) toolbar, click Plot.

The current plot group shows the temperature distribution; compare with Figure 13.

FOURTH WINDOW (COMP4)

In the Model Builder window, collapse the Fourth Window (comp4) node.

FIFTH WINDOW (COMP5)

In the Model Builder window, expand the Fifth Window (comp5) node.

DEFINITIONS (COMP5)

Variables 5

- I In the Model Builder window, expand the Fifth Window (comp5)>Definitions node, then click Variables 5.
- 2 In the Settings window for Variables, locate the Variables section.
- **3** In the table, enter the following settings:

Name	Expression	Unit	Description
L2D	<pre>int_internal(ht5.ntflux /(Te-Ti))</pre>	W/(m·K)	Thermal conductance of the frame

4 In the Model Builder window, collapse the Fifth Window (comp5)>Definitions node.

HEAT TRANSFER IN SOLIDS AND FLUIDS 5 (HT5)

Fluid 1

- I In the Model Builder window, expand the Heat Transfer in Solids and Fluids 5 (ht5) node, then click Fluid 1.
- **2** Select Domains 2, 5, 6, 8, 14, 15, and 17 only.

Heat Flux 1

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Exterior Side.
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rse.
- **6** In the $T_{\rm ext}$ text field, type Te.

Heat Flux 2

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Flat Area).

- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type $1/Rsi_n$.
- **6** In the T_{ext} text field, type Ti.

Heat Flux 3

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Corner Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rsi p.
- **6** In the $T_{\rm ext}$ text field, type Ti.
- 7 In the Model Builder window, collapse the Heat Transfer in Solids and Fluids 5 (ht5) node.

STUDY 5

In the **Home** toolbar, click **Compute**.

RESULTS

A Global Evaluation node is added in order to calculate the thermal conductance of the section and the thermal transmittance of the frame.

Thermal Conductance of the Section (L2D) 5

- I In the Results toolbar, click (8.5) Global Evaluation.
- 2 In the Settings window for Global Evaluation, type Thermal Conductance of the Section (L2D) 5 in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 5/Solution 5 (29) (sol5).
- **4** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
L2D	W/(m*K)	Thermal Conductance of the Section (L2D)
(L2D-Up*pvl)/f_wtot	W/(m^2*K)	Thermal Transmittance of the Frame (Uf)

5 Click **= Evaluate**.

TABLE

I Go to the **Table** window.

The results should be close to the expected values in Table 5.

RESULTS

Surface

- I In the Model Builder window, expand the Results>Temperature (ht5) node, then click Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- 3 From the Unit list, choose degC.
- 4 In the Temperature (ht5) toolbar, click Plot.

The current plot group shows the temperature distribution; compare with Figure 14.

FIFTH WINDOW (COMP5)

In the Model Builder window, collapse the Fifth Window (comp5) node.

Sixth Window

SIXTH WINDOW (COMP6)

In the Model Builder window, expand the Sixth Window (comp6) node.

DEFINITIONS (COMP6)

Variables 6

- I In the Model Builder window, expand the Sixth Window (comp6)>Definitions node, then click Variables 6.
- 2 In the Settings window for Variables, locate the Variables section.
- **3** In the table, enter the following settings:

Name	Expression	Unit	Description
L2D	<pre>int_internal(ht6.ntflux /(Te-Ti))</pre>	W/(m·K)	Thermal conductance of the frame

4 In the Model Builder window, collapse the Sixth Window (comp6)>Definitions node.

HEAT TRANSFER IN SOLIDS AND FLUIDS 6 (HT6)

Fluid 1

- I In the Model Builder window, expand the Heat Transfer in Solids and Fluids 6 (ht6) node, then click Fluid 1.
- 2 Select Domains 2–7, 9, and 10 only.

Heat Flux 1

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Exterior Side.
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rse.
- **6** In the $T_{\rm ext}$ text field, type Te.

Heat Flux 2

- I In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Interior Side (Flat Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type $1/Rsi_n$.
- **6** In the T_{ext} text field, type Ti.

Heat Flux 3

- In the Physics toolbar, click Boundaries and choose Heat Flux.
- 2 In the Settings window for Heat Flux, locate the Boundary Selection section.
- 3 From the Selection list, choose Internal (Corner Area).
- 4 Locate the Heat Flux section. From the Flux type list, choose Convective heat flux.
- **5** In the h text field, type 1/Rsi p.
- **6** In the T_{ext} text field, type Ti.
- 7 In the Model Builder window, collapse the Heat Transfer in Solids and Fluids 6 (ht6) node.

STUDY 6

In the **Home** toolbar, click **Compute**.

RESULTS

A Global Evaluation node is added in order to calculate the thermal conductance of the section and the thermal transmittance of the frame.

Thermal Conductance of the Section (L2D) 6

- I In the Results toolbar, click (8.5) Global Evaluation.
- 2 In the Settings window for Global Evaluation, type Thermal Conductance of the Section (L2D) 6 in the Label text field.

- 3 Locate the Data section. From the Dataset list, choose Study 6/Solution 6 (36) (sol6).
- **4** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
L2D	W/(m*K)	Thermal Conductance of the Section (L2D)
(L2D-Up*pv1)/f_wtot	W/(m^2*K)	Thermal Transmittance of the Frame (Uf)

5 Click **= Evaluate**.

TABLE

I Go to the **Table** window.

The results should be close to the expected values in Table 6.

RESULTS

Surface

- I In the Model Builder window, expand the Results>Temperature (ht6) node, then click Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- 3 From the Unit list, choose degC.
- 4 In the Temperature (ht6) toolbar, click Plot.

The current plot group shows the temperature distribution; compare with Figure 15.
