

# Homogenization in a Chemical Reactor

#### Introduction

This example illustrates how to simulate a periodic homogenization process in a space dependent chemical reactor model. This homogenization removes concentration gradients in the reactor at a set time interval.

The example demonstrates a technique by which you can implement the stopping of the time-dependent solver, then restarting it with an initial value obtained based on the solution.

## Model Definition

The example studies the concentration of a diluted species in a reactor. The chemical reaction is defined by the reaction rate kc. Only the diffusion transport is considered in the example, no convection term is included.

The initial species concentration in the reactor is 0 and a fixed concentration of 1 mol/m<sup>3</sup> is applied at the bottom boundary.

The homogenization takes place every 30 minutes, and it is assumed to be ideal. Thus, a homogeneous concentration is calculated as the average concentration in the reactor each time the solution is stopped. This concentration is then applied as the initial condition each time the solution is restarted.

Figure 1 shows the distribution of the concentration in the reactor after 30 minutes. The highest concentration appears close to the source boundary, while the lowest concentration is in the corner furthest away from it.

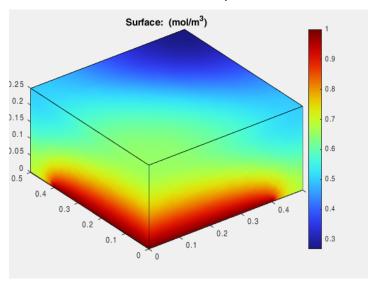

Figure 1: Concentration distribution after 30 minutes.

Figure 2 shows the concentration at the center of the top surface, defined by the coordinates (0.25m; 0.25m; 0.25m). The solid line denotes the concentration with the homogenization process. The dashed red line denotes the concentration when solving without homogenizing.

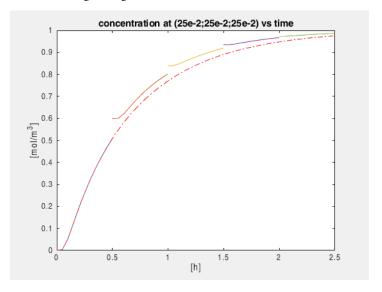

Figure 2: Evolution of the species concentration at (0.25m, 0.25m, 0.25m)

After 30 minutes the concentration in this point is much lower than the average value in the reactor. This can be seen by the jump in the concentration as the solver is restarted.

As evident from the figure the steady-state value for the concentration can be reached faster when applying the homogenization steps.

# Notes About the COMSOL Implementation

The most efficient approach for this simulation is to start by setting up the diffusion problem in the graphical user interface of the COMSOL Desktop<sup>®</sup>. You can then save the model .mph file, which you can easily load into MATLAB®, where you continue to implement the script for solving the problem, including the homogenization steps.

Wrapper functions used by the script:

- mphopen to load the model .mph file.
- mphmean to evaluate the average concentration in the reactor.
- mphinterp to evaluate the concentration at specific locations.

- mphglobal to evaluate global quantities in the model.
- mphplot to display plots.

Application Library path: LiveLink for MATLAB/Tutorials/ homogenization llmatlab

# Modeling Instructions — MATLAB®

In this section you find a detailed explanation of the commands you need to enter at the MATLAB command line in order to run the simulation.

#### I Start COMSOL with MATLAB.

You now have two possibilities to continue:

- Enter each command, starting at step 2 below, at the MATLAB command line.
- Paste the full model script, included in the section Model M-File, into a text editor, then save the file with a ".m" extension, and finally run this file in MATLAB.
- **2** As a first step load the model containing the transient diffusion problem:

```
model = mphopen('homogenization llmatlab');
```

**Note:** See the section *Modeling Instructions* — *COMSOL Desktop* for the modeling instruction of the model .mph file homogenization llmatlab.mph.

**3** To define a for-loop that runs for five iterations type:

```
for i = 1:5
```

4 The first operation in the for-loop consists in computing the solution, do this with the command:

```
model.study('std1').run;
```

For the first iteration of the for loop the solver will stop after 30 minutes, according to the parameters, t0 and T, specified in the model. For each subsequent iteration the solution will run for an additional 30 minutes, as you are changing the value of the start time t0 in steps 7 and 8 below.

5 To obtain data for the plot shown in Figure 2 extract the concentration value at the specified location. Use the function **mphinterp** as shown below:

```
[t,c] = mphinterp(model,{'t','c'},...
   'coord',[25e-2;25e-2;25e-2],...
   'unit',{'h','mol/m^3'});
```

Now you can calculate the homogenized average concentration, which is the total amount of the substance, by integrating the concentration over the volume, and divide it by the reactor volume.

**6** Evaluate the average concentration by typing the commands below:

```
c av = mphmean(model, 'c', 'volume', 'solnum', 'end');
```

7 To retrieve the current stop time from the solution, use the command mphglobal according to:

```
t0 = mphglobal(model, 't', 'solnum', 'end');
```

With the MATLAB variables c av and to define a new initial concentration and start time for the next re-start of the solver, in the next iteration of the for-loop.

**8** Do this by typing:

```
model.physics('tds').feature('init1').set('initc', 1, c av);
model.param.set('t0',t0);
```

**9** Type the sequence below to update the plot of the concentration versus time and display a message that indicates the iteration number:

```
plot(t,c)
hold on
disp(sprintf('End of iteration No.%d',i));
```

**IO** To close the for-loop type:

end

II You can add plot settings, such as title and labels for the x-axis and the y-axis by typing the command below:

```
title('concentration at (25e-2;25e-2;25e-2) vs time')
xlabel('[h]');
ylabel('[mol/m^3]');
```

12 To compare the result to the simulation without the homogenization step, you can now modify the start and stop time, and the initial concentration for the simulation with the commands:

```
model.param.set('t0',0);
model.param.set('tf','2.5[h]');
model.physics('tds').feature('init1').set('initc', 1, 0);
```

**I3** To solve again type:

```
model.study('std1').run;
```

14 Now evaluate the concentration and plot the result on the current figure:

```
[t,c] = mphinterp(model,{'t','c'},...
    'coord',[25e-2;25e-2;25e-2],...
    'unit',{'h','mol/m^3'});
plot(t,c,'r-.')

I5 To reproduce the plot in Figure 1, you can also define a plot group in the model:
    model.result.create('pg1', 'PlotGroup3D');
    model.result('pg1').feature.create('surf1', 'Surface');
```

model.result('pg1').set('solnum', '11');
l6 Finally, display the plot in a new MATLAB figure:

```
figure
mphplot(model,'pg1','rangenum',1)
```

#### MODEL M-FILE

Below you find the full script of the model. You can copy it and paste it into a text editor and save it with the ".m" extension. To run the script in MATLAB make sure that the path to the folder containing the script is set in MATLAB, then type the file name without the ".m" extension at the MATLAB prompt.

```
model = mphopen('homogenization llmatlab');
for i = 1:5
   model.study('std1').run;
   [t,c] = mphinterp(model,{'t','c'},...
      'coord',[25e-2;25e-2;25e-2],...
      'unit',{'h','mol/m^3'});
   c av = mphmean(model, 'c', 'volume', 'solnum', 'end');
   t0 = mphglobal(model, 't', 'solnum', 'end');
   model.physics('tds').feature('init1').set('initc', 1, c av);
   model.param.set('t0',t0);
   plot(t,c)
   hold on
   disp(sprintf('End of iteration No.%d',i));
end
title('concentration at (25e-2;25e-2;25e-2) vs time')
xlabel('[h]');
vlabel('[mol/m^3]')
model.param.set('t0',0);
model.param.set('tf','2.5[h]');
model.physics('tds').feature('init1').set('initc', 1, 0);
model.study('std1').run;
[t,c] = mphinterp(model,{'t','c'},...
```

```
'coord',[25e-2;25e-2;25e-2],...
   'unit',{'h','mol/m^3'});
plot(t,c,'r-.')
model.result.create('pg1', 'PlotGroup3D');
model.result('pg1').feature.create('surf1', 'Surface');
model.result('pg1').set('solnum', '11');
figure
mphplot(model,'pg1','rangenum',1)
```

# Modeling Instructions — COMSOL Desktop

Use the COMSOL Desktop to set-up the simulation of the chemical reactor. You can later load this example into MATLAB, using LiveLink™, to continue the model implementation.

From the File menu, choose New.

In the New window, click Model Wizard.

#### MODEL WIZARD

- I In the Model Wizard window, click **3D**.
- 2 In the Select Physics tree, select Chemical Species Transport> Transport of Diluted Species (tds).
- 3 Click Add.
- 4 Click Study.
- 5 In the Select Study tree, select General Studies>Time Dependent.
- 6 Click **Done**.

#### **GLOBAL DEFINITIONS**

#### Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.

#### **3** In the table, enter the following settings:

Name	Expression	Value	Description
L	50[cm]	0.5 m	Geometry length
D	2e-5[m^2/s]	2E-5 m <sup>2</sup> /s	Diffusion coefficient
c0	1[mol/m^3]	I mol/m³	Applied concentration
k	5e-11[1/s]	5E-11 1/s	Reaction rate
t0	0	0	Initial time
dt	3[min]	180 s	Output time step
T	30[min]	1800 s	Period of homogenization
tf	t0+T	1800 s	Final computational time

#### **GEOMETRY I**

Block I (blk I)

- I In the Geometry toolbar, click Block.
- 2 In the Settings window for Block, locate the Size and Shape section.
- 3 In the Width text field, type L.
- 4 In the **Depth** text field, type L.
- 5 In the Height text field, type L/2.

Work Plane I (wbl)

- I In the Geometry toolbar, click Work Plane.
- 2 In the Settings window for Work Plane, click Show Work Plane.

Work Plane I (wp I)>Plane Geometry

In the Model Builder window, click Plane Geometry.

Work Plane I (wpl)>Circular Arc I (cal)

- I In the Work Plane toolbar, click More Primitives and choose Circular Arc.
- 2 In the Settings window for Circular Arc, locate the Properties section.
- 3 From the Specify list, choose Endpoints and start angle.
- 4 Locate the Starting Point section. In the xw text field, type 4/5\*L.
- 5 Locate the Endpoint section. In the yw text field, type 4/5\*L.

Form Union (fin)

In the Model Builder window, under Component I (compl)>Geometry I right-click Form Union (fin) and choose Build Selected.

#### TRANSPORT OF DILUTED SPECIES (TDS)

#### Transport Properties 1

- I In the Model Builder window, under Component I (compl)> Transport of Diluted Species (tds) click Transport Properties 1.
- 2 In the Settings window for Transport Properties, locate the Diffusion section.
- 3 In the  $D_c$  text field, type D.

#### Reactions 1

- I In the Physics toolbar, click Domains and choose Reactions.
- 2 Select Domain 1 only.
- 3 In the Settings window for Reactions, locate the Reaction Rates section.
- **4** In the  $R_c$  text field, type k\*c.

#### Concentration I

- I In the Physics toolbar, click **Boundaries** and choose **Concentration**.
- 2 Select Boundary 3 only.
- 3 In the Settings window for Concentration, locate the Concentration section.
- **4** Select the **Species c** check box.
- **5** In the  $c_{0,c}$  text field, type c0.

#### MESH I

#### Free Tetrahedral I

In the Mesh toolbar, click A Free Tetrahedral.

#### Size 1

- I Right-click Free Tetrahedral I and choose Size.
- 2 In the Settings window for Size, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Boundary.
- **4** Select Boundary 3 only.
- 5 Locate the Element Size section. From the Predefined list, choose Extra fine.
- 6 Click Build All.

#### STUDY I

### Step 1: Time Dependent

I In the Model Builder window, under Study I click Step I: Time Dependent.

- 2 In the Settings window for Time Dependent, locate the Study Settings section.
- 3 In the Output times text field, type range(t0,dt,tf).

### SAVE THE MODEL

- I You can now save the model in the COMSOL format, from the File menu select Save.
- 2 Browse to a directory which path is set in MATLAB and enter  $\label{lem:condition_loss} \mbox{domain\_activation\_llmatlab} \ \mbox{in the {\it File name}} \ \mbox{text field}.$
- 3 Click Save.
