

# MEMS Pressure Sensor Drift Due to Hygroscopic Swelling

For their integration in microelectronic circuits, MEMS and other devices are often overmolded with an epoxy mold compound (EMC) to protect the devices and their interconnects with the board. The epoxy polymers used for such applications are subject to moisture absorption and hygroscopic swelling, which can lead to delamination between the EMC and the board or to incorrect behavior of MEMS components. This example studies how the moisture absorption of an EMC affects the response of a MEMS pressure sensor over a one-year time period.

## Model Definition

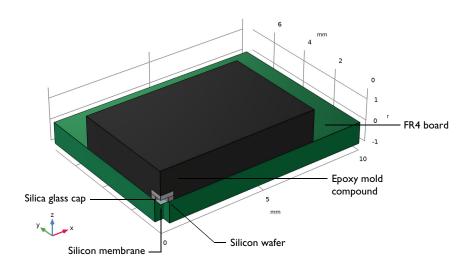

Figure 1: Component geometry.

It is sufficient to model a quarter of the whole structure due to the symmetry (Figure 1). The geometry is composed of:

• An FR4 board, on which the die is glued.

- The pressure sensor die made of:
  - A silicon component with a processed membrane. The membrane is modeled with a shell interface. The strain on the membrane surface is used to measure the pressure.
  - A silica glass capping
- An EMC that covers the die and a large part of the board.

When external pressure is applied on the bottom face of the membrane, the membrane deforms, and the strain is measured by means of a Wheatstone bridge made of piezoresistors. The measure of strain on the *X*- and *Y*-axes makes it possible to calculate the pressure. The membrane is modeled with a shell interface that is connected to the silicon domains via a shell-solid connection.

The moisture transport in the EMC is governed by the diffusion equation:

$$\frac{\partial c}{\partial t} + \nabla \cdot (-D\nabla c) = 0$$

The moisture diffusion coefficient is temperature dependent:

$$D = D_0 \exp\left(-\frac{U}{kT}\right)$$

Here U is the activation energy and k is the Boltzmann's constant. For a typical EMC,  $D_0 = 7.35 \cdot 10^{-6} \text{ m}^2/\text{s}$ , U = 0.43 eV, and the diffusion coefficient at 25°C is approximately  $4 \cdot 10^{-13} \text{ m}^2/\text{s}$ .

The boundary conditions on the exterior faces of the EMC should be a flux of moisture concentration. However, given the long simulation time (one year) a concentration constraint can be assumed. The concentration applied on the boundaries is the saturation concentration of the material at a given temperature and humidity conditions:

$$C_{\text{sat}} = SP_{\text{sat}} \varphi$$

where S is the solubility on the water in the material a given condition,  $P_{sat}$  is the vapor saturation pressure of water, and  $\phi$  is the relative humidity. The product of solubility and saturation pressure is supposed to be temperature-independent, thus the saturation concentration in the material depends only on the relative humidity. At 60% humidity, the saturation concentration is 140 mol/m<sup>3</sup>.

The initial moisture concentration after molding is set to 40 mol/m<sup>3</sup>. This value can be also taken as reference for hygroscopic swelling because all the stresses are assumed relaxed just after molding.

In order to avoid problems that can be caused by the discontinuity of concentration at initial state, the concentration boundary condition is applied smoothly, and a boundary layer type mesh is used near those boundaries (Figure 2).

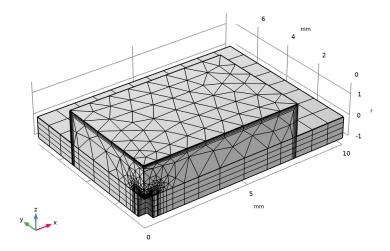

Figure 2: Mesh of the device.

As hygroscopic swelling induces a unidirectional dependence between concentration and mechanics, the concentration is calculated in a first time-dependent study, and then the structural domains are computed in a stationary study. This sequential approach reduces the computation time compared to a single solution including all physical interfaces.

## Results and Discussion

The moisture diffuses progressively in the EMC. After 6 days, the moisture has already partially reached the top face of the die (Figure 3).

Figure 4 shows that the concentration at the die location starts to increase after 2 days until approximately 100 days. This is confirmed by the mass uptake shown in Figure 5, where the maximum value is reached after the same period of time.

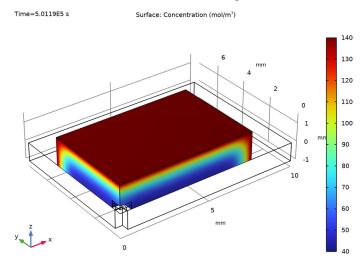

Figure 3: Moisture concentration in the EMC after 6 days.

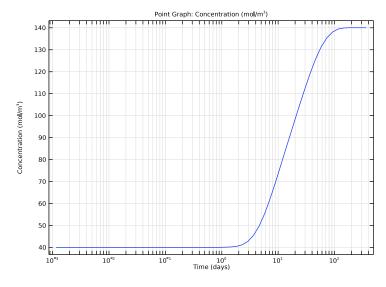

Figure 4: Moisture concentration at die location over time.

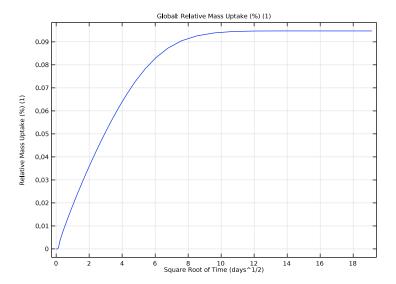

Figure 5: Total mass uptake in the EMC.

The progressive moisture diffusion is also noticed on displacement plots after hygroscopic swelling calculation: the EMC swells only on its boundaries during the first days (Figure 6), and it swells everywhere after one year (Figure 7). During the first time, the expansion on the exterior boundaries implies a stretching on the membrane and thus an increase of the measured strain. Then, the expansion of the center implies compression on the die and a decrease of the strain along the axes; see Figure 8.

The moisture absorption and hygroscopic swelling have significant effect on the sensor sensibility, which have to be taken in account during the measurements, or when designing the sensor.

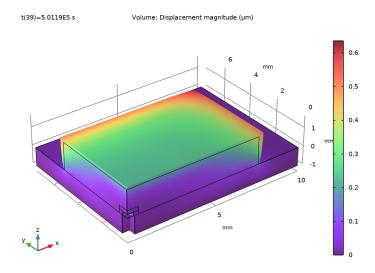

Figure 6: Displacement after 6 days.

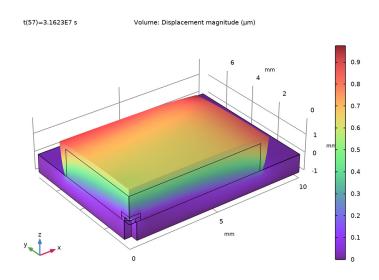

Figure 7: Displacement after 1 year.

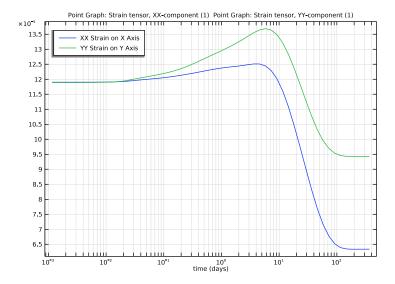

Figure 8: Evolution of measured strain on membrane axes.

# Modeling Instructions

From the File menu, choose New.

#### NEW

In the New window, click Model Wizard.

## MODEL WIZARD

- I In the Model Wizard window, click 1 3D.
- 2 In the Select Physics tree, select Structural Mechanics>Solid Mechanics (solid).
- 3 Click Add.
- 4 In the Select Physics tree, select Structural Mechanics>Shell (shell).
- 5 Click Add.

- 6 In the Select Physics tree, select Chemical Species Transport>
  Transport of Diluted Species (tds).
- 7 Click Add.
- 8 Click Study.
- 9 In the Select Study tree, select General Studies>Time Dependent.
- 10 Click M Done.

## **GLOBAL DEFINITIONS**

#### Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- **3** In the table, enter the following settings:

Name	Expression	Value	Description
1	20[mm]	0.02 m	length of the device
W	15[mm]	0.015 m	width of the device
1_MC	15[mm]	0.015 m	length of the eopxy mold compound
w_MC	10[mm]	0.01 m	width of the epoxy mold compound
l_die	1.2[mm]	0.0012 m	side length of the pressure sensor
1_memb	700[μm]	7E-4 m	side length of the silicon membrane
l_hole	800[µm]	8E-4 m	side length of the hole in FR4
t_FR4	1 [ mm ]	0.001 m	thickness of the FR4
t_Si	200[ $\mu$ m]	2E-4 m	thickness of the silicon
t_memb	20[ $\mu$ m]	2E-5 m	thickness of the silicon membrane
t_glass	200[μm]	2E-4 m	thickness of the silica glass wafer
t_MC	1.5[mm]	0.0015 m	thickness of the mold compound
cmax	140[mol/m^3]	140 mol/m³	saturated concentration of the mold compound
cini	40[mol/m^3]	40 mol/m³	initial moisture concentration

Name	Expression	Value	Description
pext	1[bar]	IE5 Pa	external pressure
t	0[s]	0 s	time used for parametric sweep

#### **GEOMETRY I**

- I In the Model Builder window, expand the Component I (compl)>Geometry I node, then click Geometry 1.
- 2 In the Settings window for Geometry, locate the Units section.
- 3 From the Length unit list, choose mm.

Create a block for the silicon wafer and the glass cap.

Block I (blk I)

- I In the Geometry toolbar, click Block.
- 2 In the Settings window for Block, locate the Size and Shape section.
- 3 In the Width text field, type 1 die/2.
- 4 In the **Depth** text field, type 1\_die/2.
- 5 In the Height text field, type t Si+t glass.
- **6** Click to expand the **Layers** section. In the table, enter the following settings:

Layer name	Thickness (mm)		
Layer 1	t_Si		

Create a block for the EMC.

Block 2 (blk2)

- I In the Geometry toolbar, click Block.
- 2 In the Settings window for Block, locate the Size and Shape section.
- 3 In the Width text field, type 1\_MC/2.
- 4 In the **Depth** text field, type w MC/2.
- 5 In the **Height** text field, type t MC.

Create a block and subtract it to make the cavity in the wafer.

Block 3 (blk3)

- I In the Geometry toolbar, click **Block**.
- 2 In the Settings window for Block, locate the Size and Shape section.

- 3 In the Width text field, type 1 memb/2.
- 4 In the Depth text field, type 1\_memb/2.
- 5 In the **Height** text field, type t\_Si.

## Difference I (dif1)

- I In the Geometry toolbar, click Booleans and Partitions and choose Difference.
- 2 Select the objects blk1 and blk2 only.
- 3 In the Settings window for Difference, locate the Difference section.
- 4 Find the **Objects to subtract** subsection. Click to select the Activate Selection toggle button.
- **5** Select the object **blk3** only.
- 6 Click **Build All Objects**.

Create a block for the board.

## Block 4 (blk4)

- I In the Geometry toolbar, click Block.
- 2 In the Settings window for Block, locate the Size and Shape section.
- 3 In the Width text field, type 1/2.
- 4 In the **Depth** text field, type w/2.
- 5 In the **Height** text field, type t\_FR4.
- **6** Locate the **Position** section. In the **z** text field, type -t FR4.

Create a block and subtract it to make a hole in the board.

## Block 5 (blk5)

- I In the Geometry toolbar, click Block.
- 2 In the Settings window for Block, locate the Size and Shape section.
- 3 In the Width text field, type 1\_hole/2.
- 4 In the **Depth** text field, type 1 hole/2.
- 5 In the **Height** text field, type t\_FR4.
- **6** Locate the **Position** section. In the **z** text field, type -t FR4.

#### Difference 2 (dif2)

- I In the Geometry toolbar, click Booleans and Partitions and choose Difference.
- **2** Select the object **blk4** only.
- 3 In the Settings window for Difference, locate the Difference section.

- 4 Find the Objects to subtract subsection. Click to select the Activate Selection toggle button.
- **5** Select the object **blk5** only.
- 6 Click **Build All Objects**.

Create a rectangle in a work plane to build the membrane.

Work Plane I (wbl)

- I In the Geometry toolbar, click Work Plane.
- 2 In the Settings window for Work Plane, click Show Work Plane.

Work Plane I (wb I)>Plane Geometry

In the Model Builder window, click Plane Geometry.

Work Plane I (wbl)>Rectangle I (rl)

- I In the Work Plane toolbar, click Rectangle.
- 2 In the Settings window for Rectangle, locate the Size and Shape section.
- 3 In the Width text field, type 1\_memb/2.
- 4 In the Height text field, type 1 memb/2.
- 5 Click **Build Selected**.
- 6 In the Model Builder window, right-click Geometry I and choose Build All.
- 7 Click the Go to Default View button in the Graphics toolbar.

#### **DEFINITIONS**

Create selections to select domains easily in the following steps.

FR4

- I In the **Definitions** toolbar, click **\( \frac{1}{3} \) Explicit**.
- 2 In the Settings window for Explicit, type FR4 in the Label text field.
- 3 Select Domain 4 only.

Silicon

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Silicon in the Label text field.
- **3** Select Domain 3 only.

Glass

I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.

- 2 In the Settings window for Explicit, type Glass in the Label text field.
- **3** Select Domain 1 only.

#### Mold Compound

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Mold Compound in the Label text field.
- **3** Select Domain 2 only.

#### Membrane

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Membrane in the Label text field.
- 3 Locate the Input Entities section. From the Geometric entity level list, choose Boundary.
- 4 Select Boundary 1 only.

#### SHELL (SHELL)

- I In the Model Builder window, under Component I (compl) click Shell (shell).
- 2 In the Settings window for Shell, locate the Boundary Selection section.
- 3 From the Selection list, choose Membrane.
- **4** Click to expand the **Default Through-Thickness Result Location** section. In the *z* text field, type -1.

#### Thickness and Offset I

Specify the shell thickness and the offset. The meshed boundary represents the shell bottom surface.

- I In the Model Builder window, under Component I (compl)>Shell (shell) click
  Thickness and Offset I.
- 2 In the Settings window for Thickness and Offset, locate the Thickness and Offset section.
- **3** In the  $d_0$  text field, type t\_memb.
- 4 From the Position list, choose Bottom surface on boundary.

Use symmetry on the shell edges. The normal of the symmetry plane is the second axis of the local edge system, which is orthogonal to the edge and to the shell normal.

#### Symmetry I

- I In the Physics toolbar, click 📙 Edges and choose Symmetry.
- 2 Select Edges 1 and 2 only.

Face Load 1

- I In the Physics toolbar, click **Boundaries** and choose Face Load.
- 2 In the Settings window for Face Load, locate the Boundary Selection section.
- 3 From the Selection list, choose Membrane.
- 4 Locate the Force section. From the Load type list, choose Pressure.
- **5** In the *p* text field, type -pext.

## SOLID MECHANICS (SOLID)

First, set the discretization to Quadratic in Solid Mechanics in order to fit the discretization of Shell.

- I In the Model Builder window, under Component I (compl) click Solid Mechanics (solid).
- 2 In the Settings window for Solid Mechanics, click to expand the Discretization section.
- 3 From the Displacement field list, choose Quadratic Lagrange.

Fixed Constraint I

- I In the Physics toolbar, click **Boundaries** and choose **Fixed Constraint**.
- 2 Select Boundary 15 only.

Symmetry 1

- I In the Physics toolbar, click **Boundaries** and choose Symmetry.
- **2** Select Boundaries 2, 3, 5, 6, 9, 13, 24, and 26 only.

#### DEFINITIONS

Create a step function in order to apply the concentration boundary condition progressively.

Steb | (steb|)

- I In the Home toolbar, click f(x) Functions and choose Global>Step.
- 2 In the Settings window for Step, locate the Parameters section.
- 3 In the Location text field, type 0.5[h].
- 4 Click to expand the **Smoothing** section. In the **Size of transition zone** text field, type 1[h].
- 5 Click Plot.

## TRANSPORT OF DILUTED SPECIES (TDS)

I In the Model Builder window, under Component I (compl) click Transport of Diluted Species (tds).

- 2 In the Settings window for Transport of Diluted Species, locate the Domain Selection section.
- 3 From the Selection list, choose Mold Compound.
- **4** Locate the **Transport Mechanisms** section. Clear the **Convection** check box.
- 5 Click to expand the **Discretization** section. From the **Concentration** list, choose **Quadratic**.

#### Transport Properties 1

- In the Model Builder window, under Component I (compl)>
   Transport of Diluted Species (tds) click Transport Properties 1.
- 2 In the Settings window for Transport Properties, locate the Diffusion section.
- 3 In the  $D_c$  text field, type 4e-13[m^2/s].

#### Initial Values 1

- I In the Model Builder window, click Initial Values I.
- 2 In the Settings window for Initial Values, locate the Initial Values section.
- **3** In the *c* text field, type cini.

#### Symmetry I

- I In the Physics toolbar, click **Boundaries** and choose Symmetry.
- **2** Select Boundaries 5 and 6 only.

#### Concentration I

- I In the Physics toolbar, click **Boundaries** and choose Concentration.
- 2 Select Boundaries 8, 20, and 29 only.
- 3 In the Settings window for Concentration, locate the Concentration section.
- 4 Select the **Species c** check box.
- **5** In the  $c_{0,c}$  text field, type cini+(cmax-cini)\*step1(t).

#### MULTIPHYSICS

Add a multiphysics node to model hygroscopic swelling.

#### Hygroscopic Swelling I (hs I)

- I In the Physics toolbar, click Multiphysics Couplings and choose Domain> Hygroscopic Swelling.
- 2 In the Settings window for Hygroscopic Swelling, locate the Domain Selection section.
- 3 From the Selection list, choose Mold Compound.

**4** Locate the **Hygroscopic Swelling Properties** section. In the  $c_{
m mo.ref}$  text field, type cini. Connect the shells and solids.

Solid-Thin Structure Connection I (sshc1)

- I In the Physics toolbar, click Multiphysics Couplings and choose Global>Solid-Thin Structure Connection.
- 2 In the Settings window for Solid-Thin Structure Connection, locate the Connection Settings section.
- 3 Select the Manual control of selections check box.
- 4 Locate the Boundary Selection, Solid section. In the list, select 11.
- 5 Click Remove from Selection.
- 6 Select Boundaries 10 and 23 only.

#### DEFINITIONS

Mass Properties I (mass I)

- I In the Model Builder window, under Component I (compl) right-click Definitions and choose Physics Utilities>Mass Properties.
- 2 In the Settings window for Mass Properties, locate the Source Selection section.
- **3** From the **Selection** list, choose **Mold Compound**.
- 4 Locate the Density section. From the Density source list, choose From physics interface.

#### MATERIALS

Add a material for each domain and for the membrane.

#### ADD MATERIAL

- I In the Home toolbar, click **Add Material** to open the Add Material window.
- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>FR4 (Circuit Board).
- **4** Click **Add to Component** in the window toolbar.
- 5 In the tree, select Built-in>Silicon.
- **6** Click **Add to Component** in the window toolbar.
- 7 Click Add to Component in the window toolbar.
- 8 In the tree, select Built-in>Silica glass.
- **9** Click **Add to Component** in the window toolbar.

10 In the Home toolbar, click 4 Add Material to close the Add Material window.

#### MATERIALS

FR4 (Circuit Board) (mat1)

- I In the Model Builder window, under Component I (compl)>Materials click FR4 (Circuit Board) (mat I).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- **3** From the **Selection** list, choose **FR4**.

Silicon (mat2)

- I In the Model Builder window, click Silicon (mat2).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- **3** From the **Selection** list, choose **Silicon**.

Silicon (membrane)

- I In the Model Builder window, under Component I (compl)>Materials click Silicon I (mat3).
- 2 In the Settings window for Material, type Silicon (membrane) in the Label text field.
- 3 Locate the Geometric Entity Selection section. From the Geometric entity level list, choose Boundary.
- 4 From the Selection list, choose Membrane.

Silica glass (mat4)

- I In the Model Builder window, click Silica glass (mat4).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Glass.

Mold Compound

- I In the Model Builder window, right-click Materials and choose Blank Material.
- 2 In the Settings window for Material, type Mold Compound in the Label text field.
- 3 Locate the Geometric Entity Selection section. From the Selection list, choose Mold Compound.

**4** Locate the **Material Contents** section. In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Young's modulus	E	22[GPa]	Pa	Young's modulus and Poisson's ratio
Poisson's ratio	nu	0.4	I	Young's modulus and Poisson's ratio
Density	rho	1900	kg/m³	Basic
Coefficient of hygroscopic swelling	beta_h_iso; beta_hii = beta_h_iso, beta_hij = 0	1.1e-4	m³/kg	Basic

- **5** Click to expand the **Appearance** section. From the **Color** list, choose **Black**.
- 6 In the Model Builder window, click Materials.
- 7 In the Settings window for Materials, in the Graphics window toolbar, click venext to **Olors**, then choose **Show Material Color and Texture** to reproduce Figure 1.

#### MESH I

Mesh the membrane using a 2D mapped mesh.

#### Mapped I

- I In the Mesh toolbar, click A Boundary and choose Mapped.
  - Use a swept mesh in the wafer domain to avoid stress singularities near the solid-shell connection.
- 2 In the Settings window for Mapped, locate the Boundary Selection section.
- 3 From the Selection list, choose Membrane.

#### Distribution I

- I Right-click Mapped I and choose Distribution.
- 2 In the Settings window for Distribution, locate the Distribution section.
- 3 In the Number of elements text field, type 10.
- 4 Locate the Edge Selection section. From the Selection list, choose All edges.

## Free Triangular I

- I In the Mesh toolbar, click A Boundary and choose Free Triangular.
- 2 Select Boundaries 11 and 16 only.

#### Swebt 1

- I In the Mesh toolbar, click A Swept.
- 2 In the Settings window for Swept, locate the Domain Selection section.
- 3 From the Geometric entity level list, choose Domain.
- 4 From the Selection list, choose Silicon.

#### Distribution I

- I Right-click Swept I and choose Distribution.
- 2 In the Settings window for Distribution, locate the Distribution section.
- 3 From the Distribution type list, choose Predefined.
- 4 In the Element ratio text field, type 5.

#### Free Tetrahedral I

- I In the Mesh toolbar, click A Free Tetrahedral.
- 2 In the Settings window for Free Tetrahedral, locate the Domain Selection section.
- 3 From the Geometric entity level list, choose Domain.
- 4 From the Selection list, choose Glass.

Add boundary layer meshing on the exterior faces in order to smooth the initial concentration discontinuity.

## Boundary Layers 1

- I In the Mesh toolbar, click Boundary Layers.
- 2 In the Settings window for Boundary Layers, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Domain.
- 4 From the Selection list, choose Mold Compound.

## Boundary Layer Properties

- I In the Model Builder window, click Boundary Layer Properties.
- 2 Select Boundaries 8, 20, and 29 only.
- 3 In the Settings window for Boundary Layer Properties, locate the Layers section.
- 4 In the Number of layers text field, type 4.

#### Swebt 2

- I In the Mesh toolbar, click A Swept.
- 2 In the Settings window for Swept, locate the Domain Selection section.
- 3 From the Geometric entity level list, choose Domain.
- 4 From the Selection list, choose FR4.

#### Distribution I

- I Right-click Swept 2 and choose Distribution.
- 2 In the Settings window for Distribution, locate the Distribution section.
- 3 In the Number of elements text field, type 4.
- 4 Click III Build All.
- 5 Click the Go to Default View button in the Graphics toolbar.

#### STUDY I

## Step 1: Time Dependent

Since the moisture diffusion is independent of the structural behavior, compute only the transport of diluted species in the time dependent analysis.

- I In the Model Builder window, under Study I click Step I: Time Dependent.
- 2 In the Settings window for Time Dependent, locate the Study Settings section.
- 3 In the Output times text field, type 0 10^range(2,0.1,7.5).
- 4 Locate the Physics and Variables Selection section. In the table, clear the Solve for check boxes for Solid Mechanics (solid) and Shell (shell).

Prepare a plot to visualize the concentration during the computation.

Solution I (soll)

#### RESULTS

#### Concentration

- I In the Model Builder window, expand the Results node.
- 2 Right-click Results and choose 3D Plot Group.
- 3 In the Settings window for 3D Plot Group, type Concentration in the Label text field.

#### Surface I

I Right-click Concentration and choose Surface.

- 2 In the Settings window for Surface, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)> Transport of Diluted Species>Species c>c - Concentration - mol/m3.
- 3 Click to expand the Range section. Select the Manual color range check box.
- 4 In the Minimum text field, type 40.
- 5 In the Maximum text field, type 140.

#### STUDY I

#### Step 1: Time Dependent

- I In the Model Builder window, under Study I click Step I: Time Dependent.
- 2 In the Settings window for Time Dependent, click to expand the Results While Solving section.
- 3 Select the Plot check box.
- 4 In the Model Builder window, click Study 1.
- 5 In the Settings window for Study, locate the Study Settings section.
- **6** Clear the **Generate default plots** check box.
- 7 In the Home toolbar, click **Compute**.

## RESULTS

#### Concentration

- I In the Settings window for 3D Plot Group, locate the Data section.
- 2 From the Time (s) list, choose 5.0119E5.
- 3 In the Concentration toolbar, click Plot.
- 4 Click the Go to Default View button in the Graphics toolbar.

#### Concentration at Die Location

- I In the Home toolbar, click In Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Concentration at Die Location in the Label text field.

## Point Graph 1

- I Right-click Concentration at Die Location and choose Point Graph.
- 2 Select Point 3 only.

- 3 In the Settings window for Point Graph, click Replace Expression in the upper-right corner of the y-Axis Data section. From the menu, choose Component I (compl)> Transport of Diluted Species>Species c>c - Concentration - mol/m3.
- 4 Locate the x-Axis Data section. From the Unit list, choose d.

#### Concentration at Die Location

- I In the Model Builder window, click Concentration at Die Location.
- 2 In the Settings window for ID Plot Group, locate the Axis section.
- **3** Select the **x-axis log scale** check box.
- 4 In the Concentration at Die Location toolbar, click Plot.
- 5 Locate the Plot Settings section.
- 6 Select the x-axis label check box. In the associated text field, type Time (days).
- 7 Click the **Zoom Extents** button in the **Graphics** toolbar.

## Mass Ubtake

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Mass Uptake in the Label text field.
- 3 Locate the Legend section. Clear the Show legends check box.

#### Global I

- I Right-click Mass Uptake and choose Global.
- 2 In the Settings window for Global, locate the y-Axis Data section.
- **3** In the table, enter the following settings:

Expression	Unit	Description		
<pre>(mass1.mass-at(0, mass1.mass))/at(0, mass1.mass)*100</pre>	1	Relative Mass Uptake (%)		

- 4 Locate the x-Axis Data section. From the Parameter list, choose Expression.
- 5 In the Expression text field, type sqrt(t[1/d]).
- **6** Select the **Description** check box. In the associated text field, type (time)^(1/2) [d<sup>(1/2)</sup>].

## Mass Uptake

- I In the Model Builder window, click Mass Uptake.
- 2 In the Settings window for ID Plot Group, locate the Plot Settings section.

- 3 Select the x-axis label check box. In the associated text field, type Square Root of Time  $(days^1/2)$ .
- 4 Locate the Axis section. Select the Manual axis limits check box.
- **5** In the **x minimum** text field, type **0**.
- 6 In the x maximum text field, type 15.
- 7 In the Mass Uptake toolbar, click Plot.
- 8 Click the **Zoom Extents** button in the **Graphics** toolbar.

Add a stationary study with a parametric sweep to compute the mechanical behavior.

#### ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies>Stationary.
- **4** Click **Add Study** in the window toolbar.
- 5 In the Home toolbar, click Add Study to close the Add Study window.

#### STUDY 2

Step 1: Stationary

- I In the Settings window for Stationary, locate the Physics and Variables Selection section.
- 2 In the table, clear the Solve for check box for Transport of Diluted Species (tds).
- 3 Click to expand the Values of Dependent Variables section. Find the Values of variables not solved for subsection. From the Settings list, choose User controlled.
- 4 From the Method list, choose Solution.
- 5 From the Study list, choose Study I, Time Dependent.
- 6 From the Time (s) list, choose Automatic (all solutions).
- 7 Click to expand the **Study Extensions** section. Select the **Auxiliary sweep** check box.
- 8 Click + Add.
- **9** In the table, enter the following settings:

Parameter name	Parameter value list	Parameter unit	
t (time used for parametric	0 10^range(2,0.1,7.5)	S	
sweep)			

Solution 2 (sol2)

- I In the Study toolbar, click Show Default Solver.
- 2 In the Model Builder window, expand the Solution 2 (sol2) node.
- 3 In the Model Builder window, expand the Study 2>Solver Configurations> Solution 2 (sol2)>Stationary Solver I node.
- 4 Right-click Study 2>Solver Configurations>Solution 2 (sol2)>Stationary Solver I and choose Fully Coupled.
- 5 In the Study toolbar, click **Compute**.

Plot stress of solid and shell in the same plot group.

#### RESULTS

Surface 1

- I In the Model Builder window, expand the Results>Stress (shell) node.
- 2 Right-click Surface I and choose Copy.

Stress

- I In the Model Builder window, under Results click Stress (solid).
- 2 In the Settings window for 3D Plot Group, type Stress in the Label text field.

Surface 1

- I Right-click Stress and choose Paste Surface.
- 2 In the Settings window for Surface, click to expand the Title section.
- **3** From the **Title type** list, choose **None**.
- 4 Click to expand the Inherit Style section. From the Plot list, choose Volume 1.

Deformation

- I In the Model Builder window, expand the Results>Stress>Volume I node, then click Deformation.
- 2 In the Settings window for Deformation, locate the Scale section.
- 3 Select the Scale factor check box. In the associated text field, type 600.
- 4 In the Stress toolbar, click Plot.

Stress (shell)

- I In the Model Builder window, under Results right-click Stress (shell) and choose Delete. Plot displacement of solid and shell in the same plot group.
- 2 In the Home toolbar, click Add Predefined Plot.

#### ADD PREDEFINED PLOT

- I Go to the Add Predefined Plot window.
- 2 In the tree, select Study 2/Solution 2 (sol2)>Solid Mechanics>Displacement (solid).
- **3** Click **Add Plot** in the window toolbar.
- 4 In the Home toolbar, click Add Predefined Plot.

#### RESULTS

## Displacement

- I In the Model Builder window, under Results click Displacement (solid).
- 2 In the Settings window for 3D Plot Group, type Displacement in the Label text field.

#### Volume 1

- I In the Model Builder window, expand the Displacement node, then click Volume I.
- 2 In the Settings window for Volume, locate the Expression section.
- **3** From the **Unit** list, choose  $\mu m$ .
- 4 In the Displacement toolbar, click Plot.

#### Deformation

- I In the Model Builder window, expand the Volume I node, then click Deformation.
- 2 In the Settings window for Deformation, locate the Scale section.
- **3** Select the **Scale factor** check box. In the associated text field, type 600.

#### Volume 2

- I In the Model Builder window, under Results>Displacement right-click Volume I and choose **Duplicate**.
- 2 In the Settings window for Volume, locate the Data section.
- 3 From the Dataset list, choose Shell.
- 4 From the Solution parameters list, choose From parent.
- 5 Click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)>Shell>Displacement>shell.disp -Displacement magnitude - m.
- 6 Locate the Expression section. From the Unit list, choose μm.
- 7 Click to expand the **Title** section. From the **Title type** list, choose **None**.
- 8 Click to expand the Inherit Style section. From the Plot list, choose Volume 1.

#### Deformation

- I In the Model Builder window, expand the Volume 2 node, then click Deformation.
- 2 In the Settings window for Deformation, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)>Shell> Displacement>u2,v2,w2 - Displacement field.

#### Displacement

- I In the Model Builder window, under Results click Displacement.
- 2 In the Settings window for 3D Plot Group, locate the Data section.
- 3 From the Parameter value (t (s)) list, choose 5.0119E5.
- 4 In the **Displacement** toolbar, click **Displacement** 1

Plot the strain on the bottom face of the membrane. To do so, add 3D cut points on the x- and y-axes.

#### Strain

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Strain in the Label text field.

#### Cut Point 3D I

- I In the Model Builder window, expand the Results>Datasets node.
- 2 Right-click Results>Datasets and choose Cut Point 3D.
- 3 In the Settings window for Cut Point 3D, locate the Data section.
- 4 From the Dataset list, choose Study 2/Solution 2 (sol2).
- **5** Locate the **Point Data** section. In the **X** text field, type 1 memb/2-30[ $\mu$ m].
- **6** In the **Y** text field, type 0.
- **7** In the **Z** text field, type 0.
- 8 From the Snapping list, choose Snap to closest boundary.

#### Cut Point 3D 2

- I In the Results toolbar, click Cut Point 3D.
- 2 In the Settings window for Cut Point 3D, locate the Data section.
- 3 From the Dataset list, choose Study 2/Solution 2 (sol2).
- 4 Locate the Point Data section. In the X text field, type 0.
- 5 In the Y text field, type 1 memb/2-30  $[\mu m]$ .
- **6** In the **Z** text field, type **0**.
- 7 From the Snapping list, choose Snap to closest boundary.

8 Click Plot.

## Point Graph 1

- I In the Model Builder window, right-click Strain and choose Point Graph.
- 2 In the Settings window for Point Graph, locate the Data section.
- 3 From the Dataset list, choose Cut Point 3D 1.
- 4 Locate the y-Axis Data section. In the Expression text field, type shell.eXX.
- 5 Locate the x-Axis Data section. From the Parameter list, choose Expression.
- 6 In the Expression text field, type t.
- **7** From the **Unit** list, choose **d**.
- 8 Click to expand the **Legends** section. Select the **Show legends** check box.
- 9 From the Legends list, choose Manual.
- **10** In the table, enter the following settings:

# Legends XX Strain on X Axis

## Point Graph 2

- I Right-click Strain and choose Point Graph.
- 2 In the Settings window for Point Graph, locate the Data section.
- 3 From the Dataset list, choose Cut Point 3D 2.
- 4 Locate the y-Axis Data section. In the Expression text field, type shell.eYY.
- 5 Locate the x-Axis Data section. From the Parameter list, choose Expression.
- **6** In the **Expression** text field, type t.
- **7** From the **Unit** list, choose **d**.
- 8 Locate the Legends section. Select the Show legends check box.
- 9 From the Legends list, choose Manual.
- **10** In the table, enter the following settings:

Legends					
YY	Strain	on	Υ	Axis	

#### Strain

- I In the Model Builder window, click Strain.
- 2 In the Settings window for ID Plot Group, locate the Axis section.

- 3 Select the x-axis log scale check box.
- 4 Locate the Plot Settings section.
- **5** Select the **x-axis label** check box. In the associated text field, type time (days).
- 6 Locate the Legend section. From the Position list, choose Upper left.
- 7 In the Strain toolbar, click Plot.
