

Geothermal Doublet

The use of geothermal energy has become an important topic worldwide, not only sparked by the debate on climate change. Particularly in regions with lower geothermal energy, the requirements for geothermal plants are high in order to ensure a continuous and longterm energy supply.

This example of a hydrothermal doublet studies the coupled porous media flow and heat transfer problem using the Darcy's Law and Heat Transfer in Porous Media interfaces. It shows how to set up a system of a layered subsurface with different geological and thermal properties including fractures and the injection and production side of a doublet.

Model Definition

The model geometry (Figure 1) consists of three geological layers ranged by a fault zone. The layers, their elevation, and the fault zone are interpolation functions from an artificial dataset. Different hydraulic and thermal properties are defined for the layers. The evolution of the flow and temperature field over 10 years is studied.

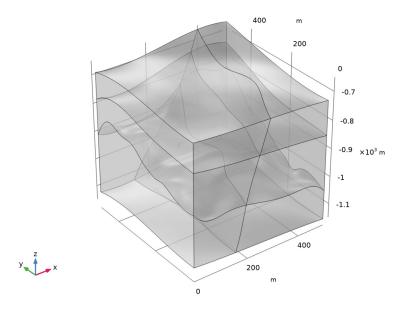

Figure 1: Geometry of the model including three geologic layers, fracture, and the doublet's production and injection side (edges).

FLUID FLOW

The flow in the fracture is in general much faster than in the surrounding porous matrix. The cubic law is a common correlation for modeling fracture flow. It defines the permeability $\kappa_f(m^2)$ in the fracture according to

$$\kappa_{\rm f} = \frac{d_{\rm f}^2}{12f_{\rm f}}$$

where $d_{\mathbf{f}}(\mathbf{m})$ is the fracture's aperture and $f_{\mathbf{f}}$ the roughness factor. With this definition, the name cubic law results from the definition of the fracture's transmissivity

$$T_{\mathbf{r}} = d_{\mathbf{f}} k_{\mathbf{f}} = \frac{d_{\mathbf{f}}^3}{12 f_{\mathbf{f}}}.$$

A hydraulic gradient in x direction is applied as boundary condition on the vertical boundaries. Top and bottom boundary are defined as impermeable. Two edges represent the geothermal doublet injection and production side. Injection and pumping is modeled using the Well feature. Water injection is defined using the mass flow rate option with $M_0 = \rho_W \cdot 120 \, l/s$.

HEAT TRANSFER

An initial geothermal gradient of 0.03 K/m is applied. The vertical boundaries are defined as open boundaries. This means that a temperature condition using the same geothermal gradient is active if $\mathbf{n} \cdot \mathbf{u} < 0$ (inflow) or otherwise $-\mathbf{n} \cdot \mathbf{q} = 0$ (outflow). Analogously to the Fracture Flow boundary condition in the Darcy's Law interface, the heat transfer in the fracture is modeled using the fracture boundary condition of the heat transfer interface.

To model the heat source term caused by the injection well, a line heat source feature is applied according to

$$Q = C_{\mathbf{p}} \frac{M_0}{l} (T_{\mathrm{inj}} - T)$$

where $C_p(J/(kg \cdot K))$ is the water heat capacity, l the well length, $T_{inj} = 278$ K the injection temperature, and T the current temperature.

Results and Discussion

The pressure field is shown in Figure 2.

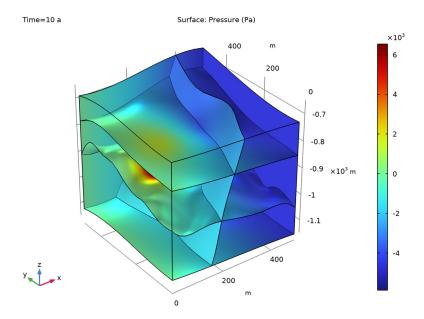

Figure 2: Pressure distribution after 10 years.

Figure 3 shows the temperature distribution in the fracture together with streamlines that visualize the flow field, showing the flow from the injection to the production side of the doublet.

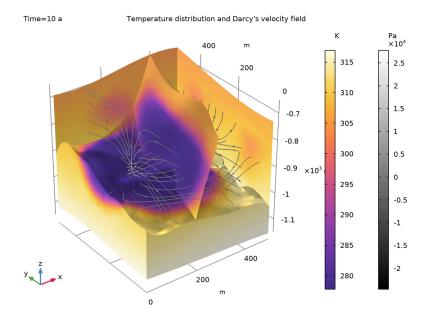

Figure 3: Temperature distribution in the fracture and streamlines for the Darcy velocity field after 10 years.

It is interesting to evaluate the production temperature over time. As shown in Figure 4, the production temperature decreases about 20 K over 10 years. This indicates that the doublet at the operating conditions will not provide a stable long term energy supply and that a different configurations should be tested. This can be done by varying one or more of the parameters in the model to see which setup is more appropriate.

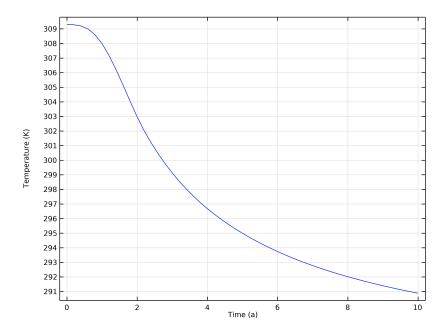

Figure 4: Production temperature over 10 years.

Application Library path: Subsurface_Flow_Module/Heat_Transfer/geothermal_doublet

Modeling Instructions

From the File menu, choose New.

NEW

In the New window, click Model Wizard.

MODEL WIZARD

- I In the Model Wizard window, click 📋 3D.
- 2 In the Select Physics tree, select Fluid Flow>Porous Media and Subsurface Flow> Darcy's Law (dl).
- 3 Click Add.

- 4 In the Select Physics tree, select Heat Transfer>Porous Media> Heat Transfer in Porous Media (ht).
- 5 Click Add.
- 6 Click M Done.

ROOT

Start with loading the parameterized geometry sequence into the model.

GEOMETRY I

- I In the Geometry toolbar, click Insert Sequence and choose Insert Sequence.
- 2 Browse to the model's Application Libraries folder and double-click the file geothermal_doublet_geom_sequence.mph.
- 3 In the Geometry toolbar, click **Build All**.

The geometry parameters that are used were added to the **Parameters** list automatically. Add a few more parameters that are used to set up the physics interfaces.

GLOBAL DEFINITIONS

Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- **3** In the table, enter the following settings:

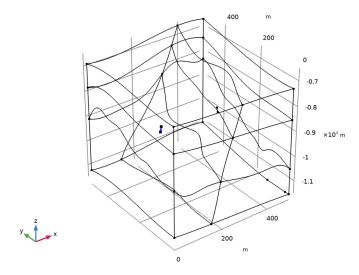

Name	Expression	Value	Description
r_bore	1[m]	l m	Borehole skin zone radius
pump	120[1/s]	0.12 m ³ /s	Pumping rate
deltaH	1 [mm/m]	0.001	Hydraulic head gradient
T_top	283[K]	283 K	Surface temperature
T_inj	278[K]	278 K	Injection temperature
delta_Tz	0.03[K/m]	0.03 K/m	Geothermal gradient
d_f	0.2[cm]	0.002 m	Fracture thickness
f_f	1.6	1.6	Fracture roughness factor

Selections help to improve the whole modeling process. Define them now and use them later where needed.

DEFINITIONS

Injection well

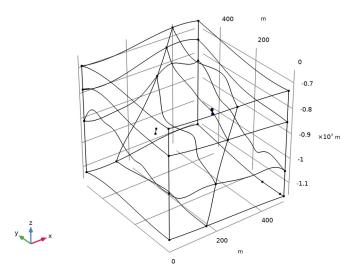

- I In the Model Builder window, expand the Component I (compl)>Definitions node.
- 2 Right-click Definitions and choose Selections>Explicit.
- 3 In the Settings window for Explicit, locate the Input Entities section.
- 4 From the Geometric entity level list, choose Edge.
- 5 Click the Wireframe Rendering button in the Graphics toolbar.
- 6 Select Edge 19 only.
- 7 In the Label text field, type Injection well.

Production well

- I In the **Definitions** toolbar, click **\(\bigcap_{\text{a}} \) Explicit**.
- 2 In the Settings window for Explicit, locate the Input Entities section.
- 3 From the Geometric entity level list, choose Edge.
- **4** Select Edge 37 only.

5 In the Label text field, type Production well.

Top layer

- I In the **Definitions** toolbar, click **\(\frac{1}{2} \) Explicit**.
- 2 Select Domains 3 and 6 only.
- 3 In the Settings window for Explicit, type Top layer in the Label text field.

Middle layer

- I In the **Definitions** toolbar, click **\(\big|_{\bigsip} Explicit. \)**
- 2 Select Domains 2 and 5 only.
- 3 In the Settings window for Explicit, type Middle layer in the Label text field.

Bottom layer

- I In the **Definitions** toolbar, click **\(\bigcap_{\text{a}} \) Explicit**.
- **2** Select Domains 1 and 4 only.
- 3 In the Settings window for Explicit, type Bottom layer in the Label text field.

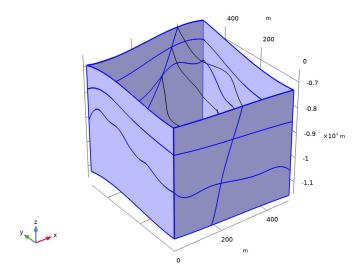

Fracture

- I In the **Definitions** toolbar, click **\(\) Explicit**.
- ${\bf 2}\;$ In the Settings window for Explicit, locate the Input Entities section.
- 3 From the Geometric entity level list, choose Boundary.
- 4 Select Boundary 21 only.

- 5 Select the Group by continuous tangent check box. This automatically adds all boundaries that belong to the large fault zone.
- 6 In the Label text field, type Fracture.

Outer boundaries

- I In the **Definitions** toolbar, click **\(\frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Outer boundaries in the Label text field.
- 3 Locate the Input Entities section. From the Geometric entity level list, choose Boundary.
- 4 Select the Group by continuous tangent check box.
- 5 Select any face on each side. Automatically all faces of this side will be added to the selection.

GLOBAL DEFINITIONS

Add materials to the materials node, but do not define their properties at this point. After setting up the physics interface COMSOL Multiphysics automatically detects which material properties are needed.

ADD MATERIAL

- I In the Home toolbar, click **‡ Add Material** to open the **Add Material** window.
- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>Water, liquid.

- 4 Click Add to Global Materials in the window toolbar.
- 5 In the Home toolbar, click Radd Material to close the Add Material window.

MATERIALS

Upper Aquitard

- I In the Model Builder window, under Component I (compl) right-click Materials and choose More Materials>Porous Material.
- 2 In the Settings window for Porous Material, type Upper Aquitand in the Label text field.

Aquifer

- I Right-click Materials and choose More Materials>Porous Material.
- 2 In the Settings window for Porous Material, type Aquifer in the Label text field.
- 3 Locate the Geometric Entity Selection section. From the Selection list, choose Middle layer.

Lower aguitard

- I Right-click Materials and choose More Materials>Porous Material.
- 2 In the Settings window for Porous Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Bottom layer.
- 4 In the Label text field, type Lower aquitard.

Fracture

- I Right-click Materials and choose More Materials>Material Link.
- 2 In the Settings window for Material Link, type Fracture in the Label text field.
- 3 Locate the Geometric Entity Selection section. From the Geometric entity level list, choose Boundary.
- **4** From the **Selection** list, choose **Fracture**.

DARCY'S LAW (DL)

Now, set up the physics interfaces. This determines which material properties are required.

Fracture 1

- I In the Model Builder window, under Component I (compl) right-click Darcy's Law (dl) and choose Fracture.
- 2 In the Settings window for Fracture, locate the Boundary Selection section.
- 3 From the Selection list, choose Fracture.
- **4** Locate the **Aperture** section. In the d_f text field, type d_f .

Fracture Material I

- I In the Model Builder window, click Fracture Material I.
- 2 In the Settings window for Fracture Material, locate the Fracture Material Properties section.
- **3** From the $\varepsilon_{\rm p}$ list, choose **User defined**. In the associated text field, type 0.6.
- 4 From the Permeability model list, choose Cubic law.
- **5** In the f_f text field, type f_f .

Hvdraulic Head 1

- I In the Physics toolbar, click **Boundaries** and choose Hydraulic Head.
- 2 In the Settings window for Hydraulic Head, locate the Boundary Selection section.
- 3 From the Selection list, choose Outer boundaries.
- **4** Locate the **Hydraulic Head** section. In the H_0 text field, type -deltaH*x.

Use the **Well** feature to define the injection and production side of the doublet.

Well I

- I In the Physics toolbar, click F Edges and choose Well.
- 2 In the Settings window for Well, locate the Edge Selection section.
- 3 From the Selection list, choose Injection well.
- **4** Locate the **Well** section. In the d_w text field, type $2*r_bore$.
- 5 From the Specify list, choose Mass flow.
- **6** Locate the **Mass Flow** section. In the M_0 text field, type pump*dl.rho.

The expression dl.rho refers to the water density that is defined by Darcy's Law interface.

Well 2

- I In the Physics toolbar, click F Edges and choose Well.
- 2 In the Settings window for Well, locate the Edge Selection section.
- **3** From the **Selection** list, choose **Production well**.
- **4** Locate the **Well** section. In the d_w text field, type $2*r_bore$.
- 5 From the Well type list, choose Production.
- 6 From the Specify list, choose Mass flow.
- 7 Locate the Mass Flow section. In the M_0 text field, type pump*dl.rho.

HEAT TRANSFER IN POROUS MEDIA (HT)

Fluid 1

- I In the Model Builder window, under Component I (compl)>
 Heat Transfer in Porous Media (ht)>Porous Medium I click Fluid I.
- 2 In the Settings window for Fluid, locate the Heat Convection section.
- 3 From the u list, choose Darcy's velocity field (dl).

Porous Matrix I

- I In the Model Builder window, click Porous Matrix I.
- 2 In the Settings window for Porous Matrix, locate the Matrix Properties section.
- 3 From the Define list, choose Solid phase properties.

Initial Values 1

Define the geothermal gradient as initial temperature distribution.

- I In the Model Builder window, under Component I (compl)>
 Heat Transfer in Porous Media (ht) click Initial Values I.
- 2 In the Settings window for Initial Values, locate the Initial Values section.
- 3 In the T text field, type $T_{top-0.03[K/m]*z}$.

Oben Boundary I

- I In the Physics toolbar, click **Boundaries** and choose **Open Boundary**.
- 2 In the Settings window for Open Boundary, locate the Boundary Selection section.
- 3 From the Selection list, choose Outer boundaries.
- 4 Locate the **Upstream Properties** section. In the $T_{\rm ustr}$ text field, type T_top-delta_Tz* z.

Fracture 1

- I In the Physics toolbar, click **Boundaries** and choose Fracture.
- 2 In the Settings window for Fracture, locate the Boundary Selection section.
- **3** From the **Selection** list, choose **Fracture**.
- 4 Locate the Shell Properties section. From the Shell type list, choose Nonlayered shell. In the $L_{\rm th}$ text field, type d_f.
- 5 Locate the Fluid Material section. From the list, choose Water, liquid (mat 1).
- 6 Locate the Heat Convection section. From the u list, choose Darcy's velocity field (dl).
- 7 Locate the Porous Material section. From the θ_p list, choose Volume fraction (dl/frac1).

- 8 Locate the Heat Conduction, Porous Matrix section. From the $k_{\rm p}$ list, choose User defined. In the associated text field, type 3.
- **9** Locate the Thermodynamics, Porous Matrix section. From the ρ_n list, choose User defined. In the associated text field, type 1.2e3.
- **10** From the $C_{p,p}$ list, choose **User defined**. In the associated text field, type 800.

Line Heat Source 1

- I In the Physics toolbar, click **Edges** and choose **Line Heat Source**.
- 2 In the Settings window for Line Heat Source, locate the Edge Selection section.
- 3 From the Selection list, choose Injection well.
- **4** Locate the **Line Heat Source** section. In the Q_1 text field, type mat1.def.Cp* dl.well1.Ml*(T inj-T).
- 5 Locate the Heat Source Radius section. Select the Specify heat source radius check box.
- **6** In the *R* text field, type r_bore.

MATERIALS

Now you can define the material properties.

Upper Aquitard (pmat I)

- I In the Model Builder window, under Component I (compl)>Materials click Upper Aquitard (pmatl).
- 2 In the Settings window for Porous Material, locate the Homogenized Properties section.
- **3** In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Permeability	kappa_iso; kappaii = kappa_iso, kappaij = 0	1e- 10[cm^2]	m²	Basic

4 Locate the Phase-Specific Properties section. Click 👯 Add Required Phase Nodes.

Solid I (pmat1.solid1)

- I In the Model Builder window, click Solid I (pmat1.solid1).
- 2 In the Settings window for Solid, locate the Solid Properties section.
- **3** In the θ_s text field, type 0.9.
- 4 From the Material list, choose Locally defined.

5 Locate the **Material Contents** section. In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Density	rho	1300	kg/m³	Basic
Heat capacity at constant pressure	Ср	900	J/(kg·K)	Basic
Thermal conductivity	k_iso ; kii = k_iso, kij = 0	2	W/(m·K)	Basic

Aquifer (pmat2)

- I In the Model Builder window, under Component I (compl)>Materials click Aquifer (pmat2).
- 2 In the Settings window for Porous Material, locate the Homogenized Properties section.
- **3** In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Permeability	kappa_iso ; kappaii =	1e-6[cm^2]	m²	Basic
	kappa_iso, kappaij = 0			

4 Locate the Phase-Specific Properties section. Click **‡** Add Required Phase Nodes.

Solid I (pmat2.solid I)

- I In the Model Builder window, click Solid I (pmat2.solid I).
- 2 In the Settings window for Solid, locate the Solid Properties section.
- 3 From the Material list, choose Locally defined.
- **4** In the θ_s text field, type 0.6.
- **5** Locate the **Material Contents** section. In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Density	rho	1900	kg/m³	Basic
Heat capacity at constant pressure	Ср	850	J/(kg·K)	Basic
Thermal conductivity	k_iso ; kii = k_iso, kij = 0	3	W/(m·K)	Basic

Lower aquitard (pmat3)

- I In the Model Builder window, under Component I (compl)>Materials click Lower aquitard (pmat3).
- 2 In the Settings window for Porous Material, locate the Homogenized Properties section.
- **3** In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Permeability	kappa_iso; kappaii = kappa_iso, kappaij = 0	1e-7[cm^2]	m²	Basic

4 Locate the Phase-Specific Properties section. Click 4 Add Required Phase Nodes.

Solid I (pmat3.solid1)

- I In the Model Builder window, click Solid I (pmat3.solidI).
- 2 In the Settings window for Solid, locate the Solid Properties section.
- **3** In the θ_s text field, type 0.7.
- 4 From the Material list, choose Locally defined.
- **5** Locate the **Material Contents** section. In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Density	rho	2300	kg/m³	Basic
Heat capacity at constant pressure	Ср	850	J/(kg·K)	Basic
Thermal conductivity	k_iso ; kii = k_iso, kij = 0	3.5	W/(m·K)	Basic

MESH I

Adjust the default mesh settings slightly to make sure, that the injection and production well are resolved properly.

- I In the Model Builder window, under Component I (compl) click Mesh I.
- 2 In the Settings window for Mesh, locate the Physics-Controlled Mesh section.
- 3 From the Element size list, choose Fine.
- 4 Locate the Sequence Type section. From the list, choose User-controlled mesh.

Size 1

- I In the Model Builder window, right-click Free Tetrahedral I and choose Size.
- 2 In the Settings window for Size, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Edge.
- 4 Select Edges 19 and 37 only.
- 5 Locate the Element Size section. From the Predefined list, choose Extra fine.
- 6 Click the **Custom** button.
- 7 Locate the Element Size Parameters section.
- 8 Select the Maximum element size check box. In the associated text field, type 4.
- 9 Click III Build All.

ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies>Stationary.
- **4** Find the **Physics interfaces in study** subsection. In the table, clear the **Solve** check box for Heat Transfer in Porous Media (ht).
- 5 Click Add Study in the window toolbar.
- 6 In the Home toolbar, click Add Study to close the Add Study window.

STUDY I

Steb 1: Stationary

- I In the Settings window for Stationary, locate the Physics and Variables Selection section.
- 2 Select the Modify model configuration for study step check box.
- 3 In the tree, select Component I (compl)>Darcy's Law (dl)>Well I and Component I (compl)>Darcy's Law (dl)>Well 2.
- 4 Click Disable.

This first stationary step results in a groundwater flow field which serves as a starting point for the subsequent time dependent analysis of the performance of the geothermal doublet.

Time Dependent

I In the Study toolbar, click 🔁 Study Steps and choose Time Dependent> Time Dependent.

- 2 In the Settings window for Time Dependent, locate the Study Settings section.
- 3 From the Time unit list, choose a.
- 4 In the Output times text field, type range (0,0.2,10).
- 5 In the Model Builder window, click Study 1.
- 6 In the Settings window for Study, locate the Study Settings section.
- 7 Clear the Generate default plots check box.

Solution I (soll)

- I In the Study toolbar, click Show Default Solver.
- 2 In the Model Builder window, expand the Solution I (soll) node, then click Time-Dependent Solver I.
- 3 In the Settings window for Time-Dependent Solver, click to expand the Time Stepping section.
- 4 From the Maximum step constraint list, choose Constant.

Constraining the maximum time step ensures that the transient behavior of the whole system is resolved properly.

5 In the Study toolbar, click **Compute**.

Add the predefined plot for the pressure and modify it to create Figure 2.

6 In the Home toolbar, click Add Predefined Plot.

ADD PREDEFINED PLOT

- I Go to the Add Predefined Plot window.
- 2 In the tree, select Study I/Solution I (soll)>Darcy's Law>Pressure (dl).
- 3 Click Add Plot in the window toolbar.

RESULTS

Selection I

- I In the Model Builder window, expand the Pressure (dl) node.
- 2 Right-click Surface and choose Selection.
- 3 In the Settings window for Selection, locate the Selection section.
- 4 From the Selection list, choose All boundaries, and remove the top and front boundaries, which corresponds to:
- **5** Select Boundaries 3, 6, 9, 11–16, 18, 20, 21, 23, and 25–29 only.
- 6 In the Pressure (dl) toolbar, click on Plot.

Temperature and Flow Field

Create the plot in Figure 3 as follows:

- I In the Home toolbar, click Add Plot Group and choose 3D Plot Group.
- 2 In the Settings window for 3D Plot Group, type Temperature and Flow Field in the **Label** text field.

Surface 1

- I Right-click Temperature and Flow Field and choose Surface.
- 2 In the Settings window for Surface, locate the Expression section.
- **3** In the **Expression** text field, type T.
- 4 Locate the Coloring and Style section. Click Change Color Table.
- 5 In the Color Table dialog box, select Thermal>HeatCameraLight in the tree.
- 6 Click OK.

Selection 1

- I Right-click Surface I and choose Selection.
- 2 In the Settings window for Selection, locate the Selection section.
- 3 From the Selection list, choose Outer boundaries.
- **4** Select Boundaries 3, 11–13, 15, 16, and 25–29 only.

Surface 2

- I In the Model Builder window, under Results>Temperature and Flow Field right-click Surface I and choose Duplicate.
- 2 In the Settings window for Surface, click to expand the Inherit Style section.
- 3 From the Plot list, choose Surface 1.

Selection I

- I In the Model Builder window, expand the Surface 2 node, then click Selection I.
- 2 In the Settings window for Selection, locate the Selection section.
- 3 From the Selection list, choose Fracture.

Volume 1

- I In the Model Builder window, right-click Temperature and Flow Field and choose Volume.
- 2 In the Settings window for Volume, locate the Expression section.
- **3** In the **Expression** text field, type T.
- 4 Click to expand the Inherit Style section. From the Plot list, choose Surface 1.

Selection 1

- I Right-click Volume I and choose Selection.
- 2 In the Settings window for Selection, locate the Selection section.
- 3 From the Selection list, choose Bottom layer.

Temperature and Flow Field

In the Model Builder window, under Results click Temperature and Flow Field.

Streamline Multislice 1

- I In the Temperature and Flow Field toolbar, click More Plots and choose Streamline Multislice.
- 2 In the Settings window for Streamline Multislice, locate the Multiplane Data section.
- 3 Find the X-planes subsection. In the Planes text field, type 2.
- 4 Find the Y-planes subsection. In the Planes text field, type 0.
- 5 Find the **Z-planes** subsection. From the **Entry method** list, choose **Coordinates**.
- 6 In the Coordinates text field, type depth w.
- 7 Locate the Streamline Positioning section. From the Positioning list, choose Uniform density.
- 8 Locate the Coloring and Style section. Find the Point style subsection. From the Type list, choose Arrow.
- **9** Click to expand the **Quality** section. From the **Recover** list, choose **Everywhere**.
- 10 In the Temperature and Flow Field toolbar, click Plot.

This recovers the accurate derivatives for the streamlines.

Color Expression 1

- I Right-click Streamline Multislice I and choose Color Expression.
- 2 In the Settings window for Color Expression, locate the Coloring and Style section.
- 3 Click Change Color Table.
- 4 In the Color Table dialog box, select Linear>GrayScale in the tree.
- 5 Click OK.

Streamline Multislice 1

- I In the Model Builder window, click Streamline Multislice I.
- 2 In the Settings window for Streamline Multislice, locate the Coloring and Style section.
- **3** Find the **Point style** subsection.
- **4** Select the **Scale factor** check box. In the associated text field, type 4000000.

Temperature and Flow Field

- I In the Model Builder window, click Temperature and Flow Field.
- 2 In the Settings window for 3D Plot Group, click to expand the Title section.
- 3 From the Title type list, choose Manual.
- 4 In the Title text area, type Temperature distribution and Darcy's velocity field.
- **5** Locate the **Plot Settings** section. Clear the **Plot dataset edges** check box.
- 6 Locate the Color Legend section. Select the Show units check box.
- 7 In the Temperature and Flow Field toolbar, click Plot.

Evaluate the production temperature and compare with Figure 4.

Line Average 1

- I In the Results toolbar, click 8.85 More Derived Values and choose Average>Line Average.
- 2 In the Settings window for Line Average, click Replace Expression in the upper-right corner of the Expressions section. From the menu, choose Component I (compl)> Heat Transfer in Porous Media>Temperature>T - Temperature - K.
- **3** Select Edge 37 only.
- 4 Click **= Evaluate**.

TABLE

- I Go to the Table window.
- 2 Click **Table Graph** in the window toolbar.

RESULTS

Production Temperature

- I In the Model Builder window, under Results click ID Plot Group 3.
- 2 In the Settings window for ID Plot Group, type Production Temperature in the Label text field.
